

Godwin March A AM

ANATOMICAL EXAMINATIONS.

A

COMPLETE SERIES

O.F

ANATOMICAL QUESTIONS,

WITH

ANSWERS.

THE ANSWERS ARRANGED SO AS TO FORM

AN ELEMENTARY SYSTEM OF ANATOMY,

AND INTENDED AS

PREPARATORY TO EXAMINATIONS AT SURGEONS'-HALL.

To which are annexed,
TABLES OF THE BONES, MUSCLES, AND ARTERIES.

VOL. II.

London:

FRINTED FOR S. HIGHLEY, NO. 24, FLEET-STREET;
AND A. CONSTABLE AND CO. EDINEURGH.

R. Edwards, Printer, Crane-Court, Fleet-Street.

ANATOMICAL

EXAMINATIONS.

PART SECOND.

containing

THE ANSWERS.

SECTION I.

OF ANATOMY IN GENERAL.

Answ.

- ANATOMY is that Science which teaches us the STRUCTURE of the human Body.
- 2 Morbid Anatomy explains the ALTERATIONS in the Structure of the Body, which are induced by Disease.
- 3 Physiology is that Science which teaches us the Functions of the Body, or the Uses of its Parts.
- 4 The component Parts of the Body are divided into Solids and Fluids.
- 5 The Solids are the Bones, Cartilages, Ligaments, Muscles, Cellular Substance, Membranes, Vessels, Nerves, Glands, Viscera, Adipose Substance, &c.

Vol. H.

Sect. I. OF ANATOMY IN GENERAL.

- 6 Bones are the most hard and flexible parts of the Body, affording support and protection to all the rest.
- 7 Cartilages are the polished elastic substances covering the ends of the Bones; and, excepting these, harder than any other parts.
- 8 Ligaments, though firm and inelastic, are flexible Bodies, connecting the Bones.
- 9 Muscles are bundles of red, soft and contractile fibres; the white hard and inelastic terminations of which are denominated Tendons, when in the form of Chords—Aponeuroses, or Fascia, when expanded as Membranes.
- 10 Cellular Membrane is a tissue of interwoven Membranes.
- 11 Membranes are sheets of interwoven Fibres.
- 12 Vessels are long cylindrical and flexible Tubes, dividing and subdividing into smaller Branches; they are of three kinds: 1. Arteries, 2. Veins, 3. Lymphatics.
- 13 Nerves are bundles of small white Cords, proceeding to, or from the Brain and Spinal Marrow.
- 14 The Glands are distinct bodies formed by a peculiar arrangement of Arteries, Veins, Lymphatics, and Nerves, in a Cellular Parenchyma.
- 15 Viscera are complicated Organs somewhat loosely contained in the great cavities of the Body, such as the Stomach, Intestines, &c.
- 16 The Adipose Substance consists of a Cellular Substance, within whose interstices an Oleagenous Fluid is deposited.
- 17 The Fluids of the Body are the BLOOD, PERSPIRABLE

Sect. I. OF ANATOMY IN GENERAL.

Answ.

MATTER, URINE, SEBACEOUS MATTER, ANIMAL OIL, CERUMINOUS MATTER, SALIVA, TEARS, Mucus, Bile, Gastric Juice, Semen, Synovia, Pancreatic-Juice, Milk, Chyle, &c.

- 18 The Blood is the Fluid which circulates through the Veins and Arteries, which supplies the Body with Nutriment, and from which all its other Fluids are secreted.
- 119 The Urine is a Fluid which is secreted by the Kidnies.
- 20 The Perspirable Matter is a Fluid exhaled from the minute Vessels of the Skin.
- 21 The Cerumen is a Fluid secreted by the Ceruminous Glands of the Meatus Auditorius Externus.
- 22 The Sebaceous Matter is a Soapy Fluid, secreted by the Sebaceous Glands of the Skin.
- pies the Cells of the Adipose Substance, and the internal Cavities of the Bones, where it is called the Medullary Substance, or Marrow.
- 23 Saliva is a Fluid secreted by the Salival Glands of the Mouth.
- 24 The Tears are a Fluid secreted by the Lachrymal Gland in each Orbit.
- 25 Mucus is a Fluid secreted by the Mucous Glands of the Mouth, Nose, &c.
- 26 Bile is a Fluid secreted by the Liver.
- 27 Gastric Juice is a Fluid secreted by the Stomach.
- 28 Semen is a Fluid secreted by the Testes, Vesiculæ Seminales, and Prostate Gland.
- 29 Synovia is a Fluid which lubricates the Surfaces of Joints.

Sect. II. OF THE BONES IN GENERAL.

Answ.

- 30 Pancreatic Juice is a Salival Fluid, secreted by the Pancreas.
- 31 Milk is a Fluid secreted by the Glands of the Female Breasts.
- 31* Chyle is a Milky Fluid obtained by digestion from our Food, and passing into the Blood Vessels is there converted into Blood.
- 32 Each kind of solid substance is considered apart, this occasions the division of Anatomy into Osteology, Osteogeny, Syndesmology, Chondrology, Myology, Adenology, Splanchnology, Bursalogy, Angiology, Neurology, &c.
- 33 Osteology treats of the Form of perfect Bones.
- 34 Osteogeny of the Ossific Process, or of the growth of Bone.
- 35 Syndesmology of the Ligaments.
- 36 Chondrology of the Cartilages.
- 37 Myology of the Muscles, and their appendages the Tendons and Aponeuroses.
- 38 Adenology of the Glands.
- 39 Splanchnology of the Viscera, and Organs of Sense.
- 40 Bursalogy of the Bursæ Muscosæ.
- 41 Angeology of the Vessels.
- 42 Neurology of the Nerves.

SECTION II.

OF THE BONES IN GENERAL.

1 The Bones are every where invested by a Membrane called *Periosteum*, whilst

Sect. II. OF THE BONES IN GENERAL.

- 2 Perichondrium is the name given to the continuation of the same Membrane over the Cartilages.
- 3 The Periosteum strengthens the union of Bones with their Epiphyses, affords attachment for Ligaments and Muscles, permits the Muscles to glide smoothly over the Bones, and conducts and supports Vessels in their passage to Bones.
- 4 A delicate Membrane which lines all the internal Cavities of Bones, is called *Internal Percosteum*.
- 5 Whose use is to form little sacs to contain the Marrow.
- Bones are divided into three Classes, viz. the LONG, or CYLINDRICAL, the BROAD, or FLAT, and the MIXED BONES.
- 7 The name of Fpiphyses has been given to the Extremities and great Projections of the Bones in the Fœtus, which at this time are united to the body of the Bones by Cartilage.
- 8 Their internal structure is spongy.
- 9 The middle Portions of the long Bones placed between the Epiphyses, are called *Diaphyses*.
- 10 Their Interior is RETICULAR. .
- 11 Their Exterior is COMPACT.
- 12 Apophyses are great Projections, or distinct portions of Bones.
- 13 They are distinguished from Epiphyses in being less easily separable from the Bone to which they belong, no Layer or Cartilage being interposed between them.

 The Epiphyses of the Fœtus become Apophyses in the adult.

Sect. II. OF THE BONES IN GENERAL.

- VASCULAR PARENCHYMA, AND OF OSSEOUS MATTER DEPOSITED IN 1T; their base, therefore, being the same with that of the Muscles, Nerves, and soft parts of the Body.
- 15 They are NOT formed of Fibres and Plates, or Lamelle.
- ally so during the Ossific Process. Their Vessels enter
- 17 By numerous small Foramina all over their external surface.
- 18 Their Vascularity is proved by the tinge which they receive in animals with whose food the Rubia Tineto-rum, or Madder, has been mixed.
- 19 The Medulla is a Oleaginous Fluid, deposited in their internal cells;
- 20 It is secreted by minute Arteries, which ramify upon the sacs of the internal Periosteum, whose Trunks
- 21 Generally penetrate the Bones about their middle by oblique canals.
- 22 The use of the Medulla is not accurately ascertained. In Soemmerring's opinion it tends to render the Bones comparatively lighter.
- 23 The External Parts of Bones are the following, Foramina, Canals, Sinuses, Sinussities, Furrows, Notches, Fossæ, Pits, Glenoid Cavities, Cotyloid Cavities, Tubercles, Tuberosities, Spines, Heads, Necks, Processes, &c.

Sect. III. OF ARTICULATION IN GENERAL.

Answ.

- 24 Foramina are holes perforating the substance of Bones, without leaving any long tract within their substance.
- 25 Canals are Foramina continued within the substance of Bones.
- 26 Sinuses are great Cavities in Bones, with small openings.
- 27 Sinuosities are superficial, but broad irregular Depressions.
- 28 Furrows are long, narrow, and superficial Canals.
- 29 Notches are Cavities in the Margins of Bones.
- 30 Fossæ are deep and large Cavities upon their Surface.
- 31 Pits are small, though deep Depressions.
- 32 Glenoid Cavities are smooth shallow Cavities for Articulation.
- 33 Cotyloid Cavities are deep and smooth for Articulation.
- 34 Tubercles are small Eminences.
- 35 Tuberosities are greater rough Elevations.
- 36 Spines are long Projections.
- 37 Heads are round Tops of Bones.
- 38 Necks are the narrow Portions of Bones beneath their Heads.
- 39 Processes are projecting Portions of Bones.

SECTION III.

OF ARTICULATION IN GENERAL.

- 1 The CONNECTION of Bones with each other is called Articulation, which is divided into three classes,
- 2 Namely, Symphysis, Synarthrosis, and Diarthrosis.
- 3 Symphysis expresses the Substance connecting Bones.

Sect. III. OF ARTICULATION IN GENERAL.

- 4 Synarthrosis expresses the IMMOVEABLE CONNECTION of Bones.
- 5 Diarthrosis expresses the MOVEABLE CONNECTION of Bones.
- 8 Symphysis is subdivided into Synostosis, Syndesmosis, Synchondrosis, Syssarcosis, and Syneu-Rosis.
- 7 Synarthrosis is subdivided into Suture, Harmonia, Schindylesis, and Gomphosis.
- 8 Diarthrosis is subdivided into Enarthrosis, Arthro-DIA, Amphiarthrosis, and Ginglymus.
- 9 Synostosis expresses the conjunction of Bones by Osseus Matter, as that of the Sphænoid and Occipital.
- 10 Syndesmosis expresses conjunction by Ligaments, as in all the moveable Joints.
- 11 Synchondrosis expresses conjunction by Cartilage, as that of the Ribs and Sternum.
- 12 Syssarcosis expresses their conjunction by Muscles, as in all the moveable Joints.
- 13 Seyneurosis expresses conjunction by Membranes, as that of the Radius and Ulna.
- 14 Suture expresses conjunction by Indented Margins, as that of the two Parietal.
- 15 Harmonia expresses the conjunction by Straighter Margins, as that of the Ossa Nasi.
- 16 Schindylesis expresses the reception of the Spine of one Bone by the Furrow of another, as the Vomer receives the Azygos Process of the Sphænoidal Bone.

Sect. III. OF ARTICULATION IN GENERAL.

- 17 Gomphosis expresses such Conjunction, as that of the Teeth with their Sockets.
- 18 Enarthrosis expresses the reception of the Head of one Bone by a Deep Cavity of another, as the Acetabulum receives the Head of the Femur.
- by a Superficial Cavity of another, as the Glenoid Cavity of the Scapula receives the Head of the Humerus.
- 20 Amphiarthrosis expresses conjunction of Bones by Plain.
 Surfaces, as those of the Cuneiform and Metatarsal
 Bones.
- 21 Ginglymus expresses the Hinge-like Articulation, as that of the Elbow Joint, of which there are three kinds;
- 22 Namely, the Ginglymus Simplex, Ginglymus Compositus, and Ginglymus Trochoides.
- 23 Ginglymus Simplex is that species where corresponding, elevated, and depressed Surfaces constitute one Joint, as that of the Elbow, &c.
- 24 Ginglymus Compositus is that species where two different hinge like Joints serve one purpose as in the Articulation of the Radius and Ulna.
- 25 Ginglymus Trochoides is that species where one Bone turns round a point of another, as the Atlas moves upon the Process of the Dentata.

Sect. IV.

OF OSTEOGENY

SECTION IV.

OF OSTEOGENY.

Answ

- 1 OSTEOGENY treats of the growth of Bones.
- 2 They are formed by the deposition of Ossific Matter, either between Membranes, or in Cartilage.
- 3 Their constituent parts are a Cellular and Vascular Parenchyma, and a Phosphate of Lime, with other saline combinations.
- 4 Ossification is thus effected: the Arteries of the part about to undergo this process become dilated; though formerly transparent, they now assume a red colour; the Cartilage itself is not transmuted into Bone, but becomes gradually absorbed, whilst the Ossific Matter is deposited in its place.
- 5 In the Diaphyses of long Bones this process begins in the middle, forming flat Rings, between the external and internal Periosteum.
- of At their Epiphyses in DISTINGT POINTS, which gradually unite, whilst in flat Bones, as
 - 7 In the Bones of the Cranium it assumes the appearance of RADII DIVERGING FROM A CENTRE.
 - s The small Bones of the Ear are perfectly formed at Birth.
 - 9 The Epiphyses are the parts latest ossified; usually
- 10 About seven or eight Years of Age.
- All About twenty Years of Age, they are converted into Apophyses by bony union with the Diaphyses.

SECTION V.

OF THE HEAD AND ITS SUTURES.

- 1 The Bones of the Head are divided into those belonging to the Cranium, and those belonging to the Face.
- 2 The Bones of the Cranium consist of two Tables, off Bony Plates, and an intermediate Diplo. Of these
- 3 The external Table is the thickest.
- 4 The Diploe is of a Cellular Structure, like the Epiphyses of the long Bones.
- 5 Pericranium is the name given to the Periosteum of these Bones.
- 6 The Bones of the Face are of an IRREGULAR structure.
- 7 The Bones of the Cranium are eight in number: the Os
 FRONTIS, two OSSA PARIETALIA, two OSSA TEMPORUM, OS OCCIPITIS, OS SPHŒNOIDES, OS ETHMOIDES.
- Of these five are proper to the Cranium, viz. The two Ossa Parietalia, two Ossa Temporum, and Oso Occipitis.
- 9 Three are common to the Cranium and Face, namely,.
 The Os FRONTIS, Os SPHENOIDES, and Os ETHMOIDES.
- Nasi, two Ossa Lachrymalia, two Ossa Mala-Rum, two Ossa Maxillaria Superiora, two Ossa Palati, two Ossa Turbinata Inferiora, Vomer, and Os Maxillare Inferiors.

- 11 The Os Frontis, is situated in the anterior part of the Cranium;
- 12 The Ossa Parietalia, in the upper and lateral parts of the Cranium;
- 13 The Ossa Temporum, in the lower lateral parts, and partly in the base of the Cranium;
- 14 The Os Occipitis, in the base and back of the Cranium;
- 15 The Os Sphænoides, in the middle of the base, and in the sides of the Cranium;
- 16 The Os Ethmoides, in the middle of the forepart of the base of the Cranium.
- 17 In the arch of the Nose are situated the Ossa Nasi.
- 18 In the anterior part of the Nasal sides of the Orbits, the Ossa Lacrymalia.
- 19 In the upper part of the Cheeks, the Ossa Malarum.
- 20 In the middle of the Face, constituting the upper Jaw, properly so called, are the Ossa Maxillaria Superiora.
- 21 In the back of the Orbits, Nares, and Palate, the Ossa Palati are placed.
- 22 In the lower part of the sides of the Nares, the Ossa Turbinata Inferiora.
- 23 In the middle of the Nares, the Vomer is situated.
- 24 The Sutures formed by the union of the Bones of the Cranium, are five in number, viz. The CORONAL, the SAGITTAL, the LAMBDOIDAL, and the two SQUAMOUS.
- 25 The Sphenoidal, the Ethmoidal, the Transverse, and the two Zygomatic Sutures, are the five

Answ.

formed by the union of the Bones of the Cranium with those of the Face.

- 26 The Harmoniæ of the Face are sixteen in number, viz.

 one perpendicular Nasal, two lateral Nasal,
 two Lachrymal, two transverse Nasal, two
 external Orbital, one Mystachial, one transverse Palatine, one longitudinal Palatine,
 two Maxillo-Palatine.
- 27 The Coronal Suture stretches from above an Inch behind the temporal side of one Orbit, over the superior part of the Cranium, to the same place on the other, connecting the two Parietal Bones to the Frontal Bone.
- 28 The Saggital Suture extends along the top of the Head from the middle of the Coronal to considerably behind the Vertex, connecting the Parietal Bones.
- 29 The Lambdoidal Suture begins at the termination of the Sagittal, and passes in the form of the Greek letter Λ forward and downward on each side, connecting the Occipital Bone to the Parietal Bones.
- ated higher upon the Cranium than the top of the external Ear, connecting on each side the upper edge of the Os Squamosum, to the lower edge of the Os Parietale, which it overlopes.
- 31 The continuations on each side of the Lambdoidal Suture into the base of the Cranium, are called the Additamenta Suture Lambdoidalis.
- 32 The Posterior Serrated Portions of the Squamous Sutures are called its Additamenta.

- 33 The Sphænoidal Suture surrounds all the edges of the Sphænoid Bone.
- 34 The Ethmoidal Suture surrounds all the edges of the Ethmoid Bone.
- tween the Cranium and Face, and joins the cranial and facial Bones.
- -36 The Zygomatic Suture is situated rather toward the anterior part of the Zygoma, it runs from above downward and backward, connecting the Zygomatic Processes of the Temporal and Cheek Bones.
- 27 The perpendicular Nasal Harmonia is situated in the middle of the Nasal Arch, connecting the two Ossa Nasi.
- 38 The lateral Nasal Harmoniæ are situated on each side of the Nasal Arch, connecting the Ossa Nasi to the Ossa Maxillaria.
- 39 The Lacrymal Harmoniæ surround the forepart of the Ossa Lachrymalia, connecting them to the Ossa Maxillaria.
 - 40 The Transverse Nasal Harmoniæ are situated at the lower part of the Nares, internally connecting the Ossa Turbinata Inferiora to the Ossa Maxillaria.
- 41 The External Orbital Harmoniæ extend from the middle of the lower side of each Orbit downward and outward, to the lower part of each Os Malæ, connecting these Bones to the Ossa Maxillaria:
- 42 The Internal Orbital Harmonia extend from the middle of the inferior edge of each Orbit, to the lower ante-

- rior part of the Sphæno-Maxillary Fissure, connecting the Ossa Malarum to the Ossa Maxillaria.
- 43 The Mystichal Harmonia connects the Maxillary Bones immediately beneath the anterior aperture of the Nostrils.
- 44 The Transverse Palatine Harmonia stretches across the back part of the Palate, connecting the Palatine Processes of the Palate Bones, to those of the Superior Maxillary Bones.
- 45 The Longitudinal Palatine Harmonia extends from the middle of the anterior to the middle of the posterior part of the Palate, connecting the Palatine Processes of the Maxillary and Palate Bones of the one side to those of the other.
- of the sides of the Nares, connecting the Palate Bones to the Bulbous Processes of the Superior Maxillary Bones.
- 47 The Vomer is connected with the Os Sphænoides above, and with the Palatine and Superior Maxillary Bones below, by Schyndylesis.
- The connection betwixt the Teeth and their Sockets is an instance of Gomphosis.

SECTION VI.

OF THE BONES OF THE HEAD.

OS FRONTIS.

- 1 The Os Frontis is SITUATED in the anterior part of the Cranium, and superior part of the Face.
- 2 It is divided into a FRONTAL and FACIAL PORTION.
- 3 The Frontal Portion is situated Superiorly, being concave internally, and convex externally, its upper edge being semicircular, and possessing a double row of Small Serræ.
- 4 The Facial Portion is situated Inferiorly, and is of a very irregular form.
- INTERNAL ANGULAR PROCESSES, at the insides of the Orbits—A NASAL PROCESS between these—two Superciliary Ridges forming arches, the inner ends of which rest on the Internal Angular Processes, and the outer ends upon the two External Angular Processes, and the outer ends upon the two External Angular Processes at the outer edge of each Orbit:—A Temporal Process and Ridge immediately behind the External Angular Processes:—two Orbiter Plates, or Processes, which run back from the Superciliary Ridges:—two Bumps of the Frontal Sinuses, which are placed immediately above the Internal Angular Processes, and Eminences some way above the middle of the Superciliary Ridges which were the points of its Ossification.—All these

Answ.

elevations are situated externally, except the orbital Plates, which project internally, where also the Spine, ascending from the root of the Nose to the middle of the semicircular edge of the Bone, may be seen.

- The Trochlearis internally, by means of its pully, and externally the Corrugator Supercilii are attached to the Internal Angular Process.
 - 7 The origin of the Temporalis and its Tendinous Aponneurosis, are attached to the Temporal Ridge.
- 8 The Falx-Cerebri—a Duplicature of the Dura Mater—a Membrane of the Brain is attended to the Spine.
- '9 The Anterior Lobes of the Brain rest on the orbital Plates.
- 10 The Depressions on this Bone are its ORBITAL DEPRES-SIONS in the orbital Plates .- Its LACHRYMAL DE-PRESSIONS situated on the same Plates, and behind its External Angular Processes .- Its DEPRESSIONS for the Pullies of the Trochleares, on the inside of its Internal Angular Processes—Its ETHMOIDAL FISSURE between its orbital Plates-Its TEMPORAL DEPRESsions behind its Processes of the same name-The GREAT CONCAVITY of the internal side of the Bone, and a Furrow along its Spine.
- 11 The Lachrymal Glands occupy the Lachrymal Depressions.
- 12 The Cribriform Plate of the Ethmoid Bone is received into the Ethmoidal Fissure.

Vot. II. 25 C

Answ.

13 The Temporal Muscles are placed in the Temporal Depressions.

14 The anterior part of the Longitudinal Sinus—a great Vein of the Dura Mater—is situated along the Furrow of its Spine.

15 The Foramina are externally two, called Superciliary, from their being situated about one third from the inner end of the Superciliary Ridges—and internally one called Cocum, situated at the root of the Spine.

16 The Superciliary Foramina transmit to the Forehead twigs of the Ophthalmic Nerve, Artery and Vein.

17 Through the Foramen Cacum an Artery and Vein occasionally pass to the Nose, and

18 A small process of the Dura Mater is fixed in it.

- 19 In the Fætus it is divided down the middle, it contains no Sinuses, and neither the orbital Plates, nor the Super-ciliary Ridges are complete in it.
- 20 It is connected superiorly to the Parietal Bones, by the Coronal Suture; posteriorly and inferiorly, to the Sphænoid Bone, by the Sphænoidal Suture; and inferiorly, to the Bones of the Face, by the Transverse Suture.
- 21 It constitutes the Forehead and upper part of the Face, it supports and defends the anterior Lobes of the Brain, and forms a great part of the Orbits.

OS PARIETALE.

22 The Os Parietale is situated at the superior and lateral part of the Scull.

- 23 It is of a *Quadrangular* figure, convex externally, and concave internally.
- 24 Its edges are, one Superior, one Inferior, one Anterior, and one Posterior.
- 25 Its angles are, one Anterior Superior, one Anterior Inferior, one Posterior Superior, and one Posterior Inferior.
- Ridge, somewhat less than half way up the Bone;—and, in the middle of the Bone just above that Ridge, an Eminence which was its Fætal Point of Ossification.
- 27 The Temporal Muscle is attached to the Temporal Ridge.
- 28 When the Convexity of the right Parietal Bone is turned outward, and its longest and most pointed angle is turned forward and downwards, the Bone will be placed in the situation it holds in the Body, and thus the side to which it belongs may be ascertained.
- 29 The Depressions on this bone are the Great con-CAVITY of its inner side—a Furrow on the inside of its upper edge—a Furrow on the inside of its inferior posterior Angle—a Furrow on the inside of its anterior inferior Angle—and frequently Pits on its internal surface.
- 30 The middle portion of the Longitudinal Sinus is placed in the Furrow on the inside of the upper edge.
- 31 The middle portion of the Lateral Sinus occupies the

Furrow on the inside of the inferior posterior Angle.

32 The anterior branch of the Arteria, Meningea, Media, or Spinous artery, it is situated in the Furrow, on the

inside of the anterior inferior Angle.

33 Vessels passing to or from the bone, and the convulsions of the brain, fill the pits on the Internal Surface.

- 34 There is only ONE Foramen in the Os Parietale, which is placed towards the posterior part of its upper edge, which transmits
- 35 An Artery to the Dura Mater, and a Vein to the Longitudinal Sinus.
- 36 Its Angles are unformed, its Sides are incomplete, nor does its Foramen exist in the fætal state.
- Superiorly it is connected to its fellow, by the Sagittal Suture, Anteriorly to the Os Frontis by the Coronal Suture, Inferiorly, to the Os Temporis, by the Squamous Suture, Posteriorly, to the Os Occipitis, by the Lambdoidal Suture, and by its anterior inferior Angle, with the Os Sphænoides.

38 It constitutes the upper and lateral part of the Skull, and protects the middle lobes of the Brain.

OS TEMPORIS.

- 39 The Os Temporis, is situated at the lower part of the side and base of the Cranium.
- 40 It is divided into three portions, viz. the SQUAMOUS, the PETROUS, and the MAMMILLARY.

- 40 The Squamous Portion is placed uppermost, is smooth externally, and has a semicircular edge.
- 42 The Mamillary Portion is situated posteriorly, and is less regular and less thin than the Squamous.
- 43 The Petrous Portion is placed inferiorly and internally, and is the least regular of all.
- downward from the portion of that name—Its-ZygoMATIC PROCESS standing outward and forward from
 the Squamous portion, and having a smooth TuBERCLE placed at the anterior inferior part of its
 base.—Its Styloid Process projecting downward
 and forward from the Petrous portion.—Its VagiNAL PROCESS placed between the Mastoid Styloid,
 and Zygomatic.—And the RIDGE internally on the
 upper part of its Petrous portion.
- 45 Internally the Mammillary process is cellular.
- 46 The Sterno, Cleido, Mastoideus, and the Trachelo Mastoideus, are attached to it.
- 47 The Aponneurosis of the Temporal Muscles is fixed to the upper edge of the Zygomatic Process.
- 48 A part of the Masseter to its lower edge.
- 49 The Temporal Muscle passes under it.
- 50 The Tuberole at its base, constitutes a part of the Joint of the lower Jaw.
- The Stylo-Hyoideus, the Stylo-Glossus and the Stylo-Pharyngeus, a Ligament to the Os Hyoides, and the Lateral Ligament of the Lower Jaw, are attached to the Styloid Process.

- 52 The Cartilage of the Meatus Auditorius Externus, is fixed to the Auditory Process.
- 53 Part of the Tentorium, a duplicature of the Dura Mater, is attached to the edge of the Petrous portion.
- CAVITY, for the articulation of the Lower Jaw, situated behind the Zygomatic, and before the Vaginal and Auditory Processes.—The Fissura Glasseri traversing the middle of that depression; a Fossa behind the Mastoid Process of the Bone, a Thimble-like Cavity internal to its Styloid Process, constituting part of the Jugular Foramen.—A Depression before its Zygomatic Process, called the Temporal.—A Furrow on the inside of its Mammillary portion.—A Furrow above, and another below the posterior surface of its Petrous portion.
 - 55 Anteriorly the Condyle of the Jaw, and posteriorly a part of the Parotid Gland, occupy the Glenoid Cavity.
 - 56 The Laxator Tympani Major, and Chorda Tympani, pass through the Fissura Glasseri.
 - 57 The origin of the Digastricus, is attached to the Mastoid Groove.
 - 58 Posteriorly the Jugular Vein, and Anteriorly the Parvagum, Glosso-Pharyngeal Nerve, and Nervus Accessorius pass through the Jugular Foramen.
 - 59 The Temporal Muscle is lodged in the Temporal Depression.
 - 60 Part of the Lateral Sinus is placed in the Furrow, in the inside of the Mammillary Portion.

OF THE BONES OF THE HEAD. Sect. VI.

Answ.

61 The Superior and Inferior Petrosal Sinuses, are lodged in the Furrows, at the upper and lower edges of the posterior surface of the Petrous portion.

62. The Foramina of this lone are externally the MEATUS Auditorius Externus, placed between its Mastoid and Zygomatic processes .- The FORAMEN STYLO-MASTOIDEUM, or opening of the FALLOPIAN AC-QUEDUCT, situated between the Styloid and the Mastoid process .- The FORAMEN CAROTIDEUM, situated in the base of its Petrous portion.-The BONY CANAL of the Eustachian Tube, placed at the external side of the Petrous portion .- The CANAL which contains the Tensor Tympani is situated, immediately above the last, and-The Foramen Mas-TOIDEUM is placed behind the Mastoid process -Internally they are the MEATUS AUDITORIUS INTERNUS, which is situated on the posterior surface of the Petrous portion, and which divides into the FALLOPIAN ACQUEDUCT Superiorly, and the TRAC-TUS FORAMINULOSUS COCHLEE inferiorly.—The opening of the Acqueductus Cochleæ is situated behind the edge of the posterior surface of the Petrous portion, immediately below the Meatus.-The opening of the Acqueductus Vestibuli is situated on the posterior surface of the Petrous portion, about five lines behind the Meatus.—A small FORAMEN is situated on the superior surface of the same portion, and-The FORAMEN COMMON to this Bone and the Sphoenoid, is placed at the Anterior part of

- its Petrous portion—The FORAMEN common to it with the Occipital, has already been described.
- 43 The Portio Dura or Facial Nerve passes outward, and an Artery enters to the Ear, by the Stylo-Mastoid Fora:

 men.
- 54 The Canalis Carotideus transmits the Carotid Artery, and the beginning of the Intercostal Nerve.
- ©5 The Foramen Mastoideum transmits an Artery to the Dura Mater, and a Vein to the lateral Sinus.
- 66 The Meatus Auditorius Internus transmits the Portio Mollis and Dura or the Auditory and the Facial Nerve.
- 67 The Fallopian Aqueduct transmits the continuation of the Facial Nerve.
- 68 The Small Foramen in the Superior Surface of the Petrous portion transmits the Vidian Nerve to join the Portio Dura.
- 69 In the Fætal State, there exists in this bone no Meatus Auditorius Externus, but merely a bony ring, nor are the Styloid processes formed.
- the Sphænoidal Suture, Superiorly to the Parietal, by the Squamous Suture, and its Additamentum; posteriorly to the Occipital by the Lambdodal Suture and its Additamentum, and to the lower jaw by Ginglymus.
- 71 The Ossa Temporum constitute the inferior lateral parts of the Cranium, support, on each side, the middle lobes

Answ.

of the Brain; transmit several Vessels and Nerves, and contain the organ of hearing.

OS OCCIPITIS.

- 72 The Os Occipitis is situated in the inferior and posterior part of the Cranium.
- 73 Its Figure is Irregularly Rhomboidal its inferior angle projecting forward, which part is called the Cuneiform process: while its superior one is rounded, and its lateral angles are obtuse. It is concave internally, and convex externally.
- 74 The ELEVATIONS on this bone are its Condyles, projections situated on each side, and somewhat anteriorly to the great Foramen in the middle of the Bone.—A rough Protuberance external to each of them—the elevated edges of the great Foramen—A Longitudinal ridge on the posterior part of the bone—A Superior, and an inferior transverse ridge—Internally it has a longitudinal and a Transverse ridge—Internally it has a long
- 75 Its Condyles are connected with The Oblique Processes of the Atlas.
- 76 The Recti Laterales of the Head, are fixed to the Protuberances external to the Condyles.
- 77 The Perpendicular Ligament of the second Vertebra,

Answ.

and that of the Anterior Arch of the Atlas, are fixed to the Anterior Edge of the great Foramen.

- 78 The Ligament of the Posterior Arch of the Atlas is attached to its posterior Edge.
- 79 The Occipita-Frontalis and the Trapezii are attached to its Superior Transverse ridge and Spine.
- 80 The Recti Majores Postici and externally to them, the Obliqui Superiores arise from the Inferior Tranverse Ridge.
- 81 The posterior part of the Falx Cerebri is fixed to the Upper portion of its internal Crucial Ridge, whilst
- 82 The Tentorium, a duplicature of the Dura Mater, is attached to its lateral Portions.
- 83 The Falx Cerebelli, a duplicature also of the Dura Mater, to its Inferior portion.
- rior Transverse ridge—one below each side of its
 Superior Transverse ridge—one on the outside of
 each Condyle, which contribute to form the Jugular
 Foramina—A small depression anterior to each
 of these—A furrow in the upper portion of the internal Crucial Spine—A furrow in the inferior portion—A furrow in each lateral portion of the same
 Spine—A depression on each side of the superior
 portion—one on each side of the inferior portion of
 the same Spine—A furrow immediately anterior to
 each of these—A great depression on the Superior
 surface of the Cunciform process, and a small furrow on each side of that depression.

Answ

- 85 Internally the Complexi, and Externally the Splenii, are fixed to the Hollow between the external Transverse Ridges.
- 36 The Recti Minores Postici to the Depression between its inferior external transverse Ridge.
- 5-7 The Jugular Formina are in part formed by the Semilunar Depressions external to the Condyles.
- 88 The Recti Minores Antici are fixed to the small depressions anterior to the Condyles.
- 89 The Recti Majores Antici before the last.
- 90 The posterior part of the Longitudinal Sinus occupies the Furrow of the upper portion of the internal crucial Ridge.
- 91 The first parts of the Lateral Sinuses are placed in the Furrows of the lateral Portions.
- 92 The Occipital Sinus rests on the Furrow of its inferior Portion.
- 93 The Posterior Lobes of the Cerebrum occupy the Great Depressions above the lateral portions.
- 94 The Lobes of the Cerebellum occupy those below.
- 95 The terminations of the Lateral Sinuses are placed in the Furrows, immediately before these inferior Depressions.
- 96 The Medulta Oblongata is placed on the Superior Surface of the Cuneiform Process.
- 97 The Inferior Petrosal Sinuses rest on the small Furrows on each side of it.
- 98 The Foramina are the FORAMEN MAGNUM immediately behind the Cuneiform process and the two Con-

Answ.

dyles of the bone.—The FORAMINA CONDYLOIDEA POSTERIORA, immediately behind the Condyles, and the FORAMINA CONDYLOIDEA ANTERIORA immediately before the Condyles.

- 99 The Foramen Magnum transmits the Medulla Spinalis, the Nervi Accessorii, the Vetebral Arteries, and sometimes the Vetebral Veins.
- 100 The Foramen Condyloideum Posterius transmits the Cervical Veins and the Lateral Sinus.
- 101 The Foramen Condyloideum Anterius transmits the Ninth pair of Nerves to the Tongue.
- ramen, and all the Bone posterior to it, in the fætali state, are easily separable into four portions.
- Synostosis, inferiorly to the Sphoenoid Bone by Synostosis, inferiorly to the Atlas, by Ginglymus Compositus, laterally to the Temporal Bones by the Additamenta of the Lambdoidal Suture, and superiorly to the Parietal bones by that Suture itself.
- 104 It forms the posterior, and a part of the inferior portion of the Cranium, it contains and defends the posterior Lobes of the Cerebrum, the Cerebellum, and Medulla Oblongata and gives exit to the Spinal Marrow.

Answ.

OS SPHŒNOIDES.

- other, across the middle of the base of the Cranium.
- 106 It is divided into a Body situated in the middle: an ALA on each side of it, and Two PTERYGOID PORTIONS at its inferior part.
- TOT The ELEVATIONS on this Bone are the PROCESSUS AZYgos, standing forward and downward from its body.-The POSTERIOR CLINOID PROCESSES projecting upward and downward from the back part of its body.-The ANTERIOR CLINOID PROCESSES, one on each side placed anterior to these. The TRANSVERSE SPINOUS PROCESSES, which are lateral continuations of the anterior Clinoid. The ETHMOIDAL PROCESS projecting anteriorly between the two last.—The ORBITAL PROCESS, portions of the Ala turned toward the Orbits.—The TEMPORAL PROCESSES, portions of the Ala turned toward the Temples .- The Spinous processes which are posterior parts of the Ala.-The STYLIFORM PROCESSES which project down ward from the points of the Spinious. The EXTER-NAL PTERYGOID PLATE which is the outer part of the Pterygoid portions, and the INTERNAL PTERYGOID PLATE surmounted by a HOOK-LIKE PROCESS forming the inner part of the Prerygoid portions.

108 The Vomer is joined to the Processus Azygos.

$Sect. \ { m VI.}$ of the bones of the head.

Answ.

external

109 The Pterygoideus externus is fixed to the internal side of the external Pterygoid Plate.

- 110 The Tendon of the Tensor Palati passes over the Hook-like process.
- The Depressions are one on each side of its processus Azygos.—one between its Clinoid processes, called the Sella Turcica.—A Furrow on each side of that—Depressions on its Orbitar processes—Depressions on its Temporal processes—A furrow on the anterior edge of the last—A Depression between the Temporal process and the Pterygoid portion of the Bone.—The great Superior Concavities of the Alæ—A furrow internal to the base of the Pterygoid portions—A small Cavity behind the base of the internal Pterygoid process, and the Fossa Ptery-Goidean between the Pterygoid processes.
- 712 Those on each side the Processus Azygos constitute a portion of the Nares.
- 113 The Pituitary Gland is situated in the Sella Tur-sica.
- 114 The Carotid Arteries occupy the Furrows at its sides.
- 115 The Temporal Muscle is in the Temporal Depression.
- 316 A Nerve from the Superior Maxillary to the Temporal Muscle, passes in the Furrows on the anterior edge of the Temporal depression.
- 117 In the Depression between the Temporal and the Pterygoid Processes, the Pterygoideus Externus is situated.

- 118 A Middle Lobe of the Brain tests on the internal cavity of each Ala.
- 119 An Artery, Vein, and Nerve pass to the Nares along the Furrow, internal to the Base of the Pterygoid Portion.
- 120 Part of the Eustachean Tube is situated in the Cavity behind the base of the Pterygoid Process.
- 121 The Pterygoideus Internus fills the Pterigoid Fossa.
- ses on each side of the Processus Azygos.—The Foramina Oppica internal to its anterior Clinoid processes.

 —The Foramina Lacera placed between the Transverse Spinous Processes, and the roots of its Ala.—

 The Foramina Rotunda placed immediately below the former.—The Foramina Ovalia placed somewhat externally and posteriorly to the last.—The Foramina Spinosa placed posteriorly to these, and the Foramina Vidia which perforate the base of each Pterygoid portion from before backward.
 - 123 The Sphænoidal Sinuses serve to increase the Tone of the Voice, and not to detain odour as Blumenbach has erroneously imagined.
 - 124 The Optic Nerves and Ophathalmic Arteries pass through the Foramina Optica.
 - the Sixth Pair of Nerves, except a reflected twig which forms the commencement of the great Sympathetic, enter the orbit through the Foramina Lacera.
 - 126 The Second Branches of the Fifth Pair, or the Superior

Answ.

Maxillary Nerves pass through the Foramina Ro-

- 127 The Foramina Ovalia transmit the Third Branch of the Fifth Pair or the Inferior Maxillary.
- Dura Mater passes through the Foramen Spinosum.
- Nerve enters the Cranium through the Vidian Foramen.
- 130 In the Fætus this bone has no Sinuses, and is separable from the Ala.
- Malarum, Ossa Palati, Ossa Maxillaria by the Sphonoidal Suture, and to the Vomer by Schindylesis posteriorly to the Os Occipitis by Synostosis, and laterally to the Ossa Parietalia by its own Suture.
- of the base of the Cranium, it supports the Middle Lobes of the Brain; it forms a part of the orbits; it transmits numerous Vessels, and Nerves, &c.

OS ETHMOIDES.

- The Os Ethmoides is situated in the middle of the anterior part of the base of the Cranium.
- 134 It is somewhat cubical.
- 135 Consisting of a Cribriform Lamella, a Nasal Lamella, two Ossa Plana, Cellulæ and two Ossa Turbinata.
- 136 The Cribriform Lamella is situated horizontally in the base of the Cranium, the Nasal Lamella passes per-

Answ.

pendicularly downward from the middle of it; the Ossa Turbinata are situated at a little distance from the Nasal Lamella; the Cellulæ are immediately external to the Ossa Turbinata: and the Ossa Plana are the most external of all.

- 137 The Crista Galli is the name given to the eminence which rises from the Cribriform Plate.
- 138 Numerous holes, for the transmission of the Olfactory Nerve, pierce the Cribriform plate.
- 139 On the Ossa Turbinata Superiora are seen excessively numerous holes for the Expansion of the Olfactory. Nerve.
- 140 In the Ossa Plana there are the Foramina Orbitaria Interna, the anterior of which transmits the Nasal Twig of the first branch of the fifth pair of Nerves, and a small branch of the Ophthalmic Artery, and the posterior merely a branch of the Artery.
- 141 It is joined to the Os Frontis, Ossa, Nasi, Ossa Maxillaria Superiora, Ossa Palati, and Os Sphænoides, by the Ethmoidal Suture, and to the Vomer by Schindylesis.
- 142 In a Fætus of nine months, the Crista Galli, and Nasal-Lamella not being ossified, the bone consists of twoportions.
- 143 It supports the Anterior Lobes of the Brains, gives at tachment to the Falx, transmits the Olfactory Nerves, and forms part of the Septum Nasi.

Vol. II.

OS NASI.

Answ.

144 The Os Nası is placed in the arch of the Nose.

- narrow at its upper part, narrower still in the middle, and broadest at the base; its root and anterior edge is thickest, the latter projecting inward to join the Septum, its outer edges superiorly are overloped by the Maxillary bones, and inferiorly overlope them; its lower edges are thin and irregular.
 - Transverse Suture: anteriorly to the Frontal bone, by the Transverse Suture: anteriorly to its fellow by the perpendicular Nasal Harmonia; externally to the superior Maxillary bone by the Oblique Nasal Harmonia; posteriorly to the Septum Narium by Schindylesis; and inferiorly to the Cartilages of the Nose.
 - 147 In the Fætus it is proportionally shorter than in the Adult.
 - 148 It covers and defends the Nares.

OS LACHRYMALE.

- 149 The Os LACHRYMALE is placed at the Anterior edge of the inner side of the Orbit.
- an anterior greove, its internal side is exactly the reverse.

Answ.

- 151 The Lachrymal Sac is received into the Groove.
- 152 The Ball of the eye rests in part on the Flat Surface.
- 153 The Ethmoidal Cells are covered by its internal Surface.
- 154 It is joined to the Os Frontis, Os Ethmoides, and Os Maxillare by the Lachrymal Sutures.
- 155 In the Fatus, this bone considerably resembles that of the Adult.
- Duct, and also the Anterior part of the inner side of the Orbit.

OS MALÆ.

- 157 The Os MALE forms the prominence of the cheek,
- 158. It is irregularly square.
- or inferior angle, its inferior orbitar process or superior angle of the inner side, its internal orbitar process projecting inward from its upper part, its external orbitar process, or superior external angle, and its Zygomatic process or inferior external angle.
- 160 The Zygomatic Muscles arise from its outside.
- 161 The Aponeurosis is of the Temporal Muscle, is attached to its Edge between the Zygomatic and superior orbitar process.
- 162 The Depressions are the Orbitar depression in the Or-

Answ.

bitar process and the Temporal depression behind the Zygomatic process.

163 The Orbitar depression contains part of the ball of the Eye, and the Temporal depression part of the Temporal Muscle.

164 It has only one Foramen placed below the middle of its upper edge, through which passes,

165 A Nervous Twig.

- 165 It is connected at its posterior inferior angle to the Os Temporis by the Zygomatic Suture; at its superior orbitar process, to the Os Frontis by the Transverse Suture; at its internal orbitar process to the orbital process of the Sphænoid bone by part of the Sphænoidal Suture; to the orbitar process of the Os Maxillare by the internal orbitar Suture; and at its anterior edge to the same bone by the external orbitar Suture.
 - 167 It is fully Ossified in a nine months Fætus.
 - 168 It forms the prominence of the Cheek and part of the Orbit, protects the Temporal Muscle, and gives attachment to its Aponeurosis.

OS MAXILLARE SUPERIUS.

- 169 The Os MAXILLARE Superius is placed at the anterior inferior part of the upper Maxilla.
- 170 It is very irregular.
- 171 Its Eminunces are seven in number, viz. the Alveolar

Answ.

Process at its inferior edge, the Palatine Process projecting backward and inward from above the Alveolar Process, the Spinous Process rising from the inner edge of the Palatine, the Nasal Process ascending from the anterior part of the Alveolar, the Bulbous Process situated behind the Nasal, the Orbitar Process which forms the upper part of the Bulbous, and the Malar Process which is placed at its outer side.

- 172 The Teeth are contained in the holes of the Alveolar Process.
- 173 The Palatine Process forms the floor of the Nares, and the arch of the Palate.
- 174 The lower edge of the Septum Narium is fixed to the Spinous Process.
- with the groove of the Lacrymal bone, a Cavity which contains the Lacrymal Sac.
- 176 The Pterygoideus Externus arises from the posterior part of the Bulbous Tuberosity.
- 177 From the anterior inner edge of the Orbitar process, the inferior oblique Muscle of the Eye arises.
- depression on the lower side of the Palatine Process, the Nasal depression on its upper side, a small depression on the forepart of the Alveolar process, a more considerable one between the Alveolar and Malar Processes, the Temporal depression placed behind the

Answ.

Malar Process, the Orbitar depression of the Orbitar Process, and the Lachrymal depression on the posterior part of the Nasal Process.

- 179 The Depressor Latin Superioris is fixed to the anterior part of the Alveolar Process.
- 180 The Levator Labiorum Communis and Levator Labii Superioris arise from the Depression between the Alveolar and Malar Processes.
- 181 The Temporal Muscle is situated in the Temporal Depression.
- common, viz. the Infra Orbitary Foramen below the anterior inferior edge of the orbit, being the opening of a Canal which passes forward under the Orbitar Process; the Foramen Incisivum, placed behind the inner Inciser oo h joining its fellow at the other side inferior, but endistinct from it superiorly; the Sphæno-Maxillary issure at the curer side of the Orbit, and the Palatine Foramen, common to this and the Pa ate Bon, and formed by a F sa on the inner side of the back of the Bulbous Process, and another in the Masal and Palatine Plates; and lastly, the opening of he Antrum Maxila set seen the two Turbitated nes.
- and a branch of the second ranc of the fifth pair of Nerves, and a branch of the Internal Maxillary Artery, pass through the Infra Orbitary Foramen.

Answ

- 184 A small Artery Vein and Nerve pass through the Forumen Incisivum.
- 185 Twigs of Arteries, Veins and Nerves are transmitted by the Sphano-Maxillary Foramen.
- 186 The Palatine Artery and Nerve are placed in the Palatine Forumen.
- 187 In the Fætal State, the Bulbous and Palatine Processes are imperfect; some months before birth the rudiments of the first set of teeth are distinctly formed.
- 188 It is joined, by the tip of its Nasal Process to the Os Frontis by the Transverse Suture; by the side of the Nasal Process to the Os Unguis by the Lachrymal Suture; by the anterior edge of the Nasal Process to the Os Nasi by the oblique Nasal Suture; by the Malar Process to the Os Malæ, by the external Orbitar Suture; by its Orbitar Process to the Os Malæ, by the Internal Orbital Suture; by the same process to the Ethmoid Bone, by the Ethmoid Suture: by its Bulbous Process to the Os Palati, by the Maxillo Palatine Suture; by its Palatine Process to the Palate Bone, by the Transverse Palatine Suture; by its Spinous Process the Vomer, by Schindylesis; by the sockets in the Alveolar Process to the Teeth, by Gomphosis; by its Palatine Process to its fellow, by the Longitudinal Palatine Suture; above the middle Inciser Teeth to its fellow, by the Mystachial Suture; and to the Inferior Turbinated Bonc. by the Transverse Nasal Suture.

Answ.

189 It forms a great part of the upper Maxilla, composes a part of the Orbit, Nose and Palate, gives origin to various Muscles, and transmissions to Nerves, Arteries, and Veins.

OS PALATI.

- 190 The Os Palati is placed at the Posterior part of the Orbit, Nares and Palate.
- 191 It is divided into four portions, namely, its Palatine, Pterygoid, Nasal, and Orbitar Processes.
- 192 The Palatine Process is placed at the posterior part of the Arch of the Palate.
- 193 The Nasal Lamella is placed posteriorly and externally to the former.
- 194 The Pterygoid Process ascends from the outer edge of its Palatine Portion.
- 195 The Posterior Orbitar Process is connected to the base of the Sphoenoid bone, and the Anterior one is placed at the back of the lower side of the Orbit.
- 196 The EMINENCES on this bone are its Spinous Process rising from the inner edge of the Palatine Process, and a Transverse Ridge on the inside of its Nasal Portion.
- 197 Part of the edge of the Vomer is attached to the upper edge of the Spinous Process.
- 198 The Azygos Uvulæ to its posterior end.
- 199 The Velum Pendulum Palati to the posterior edge of the Palatine Portion.

- 200 The posterior end of the Inferior Turbinated Bone rests on the Transverse Ridge on the inside of the Nasal Lamella.
- 201 The Depressions are one on the upper part of the Palatine Portion for the Nares, another on its lower part for the Palate, and three upon the Posterior part of the Pterygoid Portion, of which the Lateral ones receive the Pterygoid Processes of the Sphoenoid Bone, and the middle one contributes to form the Fossa Pterygoidea.
- 202 Besides the Foramen, properly called Palatine, and comcomon to this bone with the superior Maxillary, there are several smaller ones which pass upward to join it.
- 203 In a nine months Fætus its form is considerably perfect.
- It is connected, by the Anterior edge of its Palatine portion to the Os Maxillare Superius, by the Transverse Palatine Suture; by its Nasal and Anterior Orbitar Process to the same bone, by the Maxillo Palatine Suture; by its Pterygoid Process, and the back of its Nasal Portion to the Pterygoid Portion of the Sphænoid bone, by the Sphænoid Suture; by its Orbitar Process to the Ethmoid bone, by the Ethmoidal Suture; by the Transverse ridge of its Nasal Portion to the Inferior Turbinated bone, by the Transverse Nasal Suture; by its Orbitar Process to the body of the Sphænoid bone, by the Sphænoidal Suture; by the

Answ.

Internal edges of its Palatine Portion to its fellow, by the Longitudinal Palatine Suture; and by its Spinous Process to the Vomer, by Schindylesis.

205 It forms part of the Orbits, Nares, and Palate, and of the Sphoenoidal, Ethmoidal, and Maxillary Sinuses.

OS TURBINATUM INFERIUS.

- 206 THE INFERIOR TURBINATED BONE is placed on the inner side of the Nares.
- 207 It somewhat resembles the superior one, but from its anterior part a small plate ascends to form part of the Lachrymal Duct, and from its posterior part another descends to cover a part of the Antrum Highmorianum.
- 208 In the Fatus it considerably resembles its Adult state.
- 209 It is joined to the Os Lachrymale, Os Maxillare, and Os Palati by the Transverse Nasal Suture.
- 210 Its use is to give expansion to Nerves, and partly to form the Antrum and Lachrymal Duct.

VOMER.

- 211 THE VOMER is placed in the middle of the Nares and forms the posterior inferior part of the Septum.
- *12 It is irregularly Rhomboidal, consisting of two Lamellæ which leave a Canal along its middle, and its posterior superior part is thickest.
- 213 In a Fætus of nine months its Lamellæ are separated by Cartilage.

Answ.

- 214 It is connected by its anterior edge to the Cartilage of the Septum by its inferior edge, to the Spinous Processes of the Maxillary and Palate Bones by Schindylesis, by its upper edge to the Nasal Lamellæ of the Ethmoid and Processus Azygos of the Sphænoid Bone also by Schindylesis.
- 215 Its chief uses are to divide the Nares and permit the expansion of the Olfactory Nerve.

OS MAXILLARE INFERIUS.

- 216 It is placed at the lower part of the face.
- Foramina; the sides, extending backward from the Foramina; the angles, in which the sides terminate and the Rami, which ascend from the angles.
- Posterior of the two arising from each Ramus; the Coronoid Process which is the anterior one; a protuberance on the outer, and another on the inner side of each angle; a ridge passing externally, and another internally from the base of the Coronoid Process to the commencement of the Chin; a protuberance immediately behind the Symphysis of the Jaw; and another on each side the base of the chin.
- 219 The Temporal Muscles are attached to the inner side of the Coronoid Processes.
- 220 The Masseter Muscles are attached to the outer side of its angles.

- 221 The Internal Pterygoid Muscles to the inner side of its angles.
- 222 The Mylo-Hyoideus to the internal line from the coronoid process to the Chin.
- 223 The Buccinator to the external line in the same direction.
- 224 The Frenum of the Tongue superiorly, the Genio-Hyoidei inferiorly, and the Genio-Glossi between these,
 are fixed to the protuberance immediately behind the
 Symphisis of the lower Jaw.
- 225 The Depressores Anguli Oris et Labii Inferioris are attached to the projections at the anterior part of the base of the Chin.
- 226 There is one depression immediately before each Condyloid Process, another on each side of the anterior surface of the Chin, and two on the base of the Chin.
- 227 The Pterygoideus Externus is fixed immediately before the Condyle.
- 228 The Depressores and Lavatores Labii Inferioris are attached to the anterior surface of the Chin.
- 229 The Digastrici to the depression on the base of the Chin.
- one being placed externally and anteriorly called the Mental Foramen; the other internally and posteriorly; they are openings of one Canal.
- 231 The inferior Maxillary Artery and Vein, and a branch

Answ.

- of the third branch of the fifth pair of Nerves to the teeth enter the bone at the posterior and internal hole; the Mental Foramen transmits some of their branches to the Chin.
- 232 In the Small Canal on the inner side of the posterior Foramen, a branch of Nerve passes to the Sublingual Gland and Mylo-Hyoideus.
- 233 In the Fætal State it is divided in two at the Chin by a thin Cartilage, hence this part has been called the Symphisis. As in the upper Jaw, the rudiments of the first-set of teeth are distinctly formed.
- 234 It is articulated by its Condyloid Processes, to the Temporal bone.
- 235 It is of much use in Mastication, Deglutition, and Speech.

THE TEETH.

- 236 There are Thirty-two Teeth in the Adult.
- 237 Situated in the Alveolar Processes of the Jaws.
- 238 They consist of two substances, one internal and bony, and another external and very hard, called Enamel.
- 239 Upon the tops of the teeth the Enamel is formed thickest.
- 240 The Fibres of the Enamel are disposed as Radii from the centre of each Tooth.
- 241 The Fibres of the bony part are generally arranged in a perpendicular direction.
- 242 Each Tooth is divided into a large portion external to

Answ.

the Socket, called its *Corona*, into a narrow part below this called its *neck*, and one, two, or three processes proceeding from the Neck, called the *roots*.

- 243 The Fangs, Neck, and Corona of each tooth are hollow and contain,
- 244 A branch of an Artery, Vein and Nerve.
- 245 The Teeth are arranged in three classes, namely Incisivi, Canini, and Molares.
- 246 There are eight incisores, four in the front of each Jaw.
- 247 They somewhat resemble Wedges, having a sharp cutting edge.
- 248 The two middle ones are the largest in the upper Jaw.
- 249 The lateral ones in the lower Jaw.
- 250 The Canini are placed on each side of the Incisores.
- 251 They are Four in number.
- 252 They are larger than the Incisores and pointed.
- 253 The Molares are the Teeth placed behind the Incisores.
- 254 Their number is Twenty.
- 255 The two Anterior on each side of both Jaws are called Bicuspides.
- 256 These have a double pointed Corona, and have one or two Fangs.
- 257 The Posterior Molares, one on each side of both Jaws, are called Dentes Sapientia.

- 258 They have a large irregular Corona and fewer Fangs than the other Molares.
- 259 The third and fourth Molares have a large Corona, and in the lower Jaw have two, in the upper three roots.
- small pulpy substances placed in the Alveolar processes of the Jaws.
- 261 About the fourth month of the fætal state the pulps are discernible.
- 262: They are firm, semi transparent, and supplied with numerous vessels.
- 568. They are invested by thin Capsules.
- 264 These may be easily separated into two layers, of which the external is vascular and spongy.
- 265 A small portion of fluid is interposed between the Capsule and Pulp.
- 266 Ossification commences on the Pulps at the eighth-
- 267 In one or more points.
- 268 The Capsule adheres to the neck of each Tooth, and:
- 269 The Enamel.
- 270 Twenty Teeth form the first set, viza
- 271 Eight Incisivi, four Canine, and eight Molares.
- 272 They begin to appear through the Gums usually about the age of six months, and are completed at two years old.
- 273 About seven years of age they begin to be shed.

Answ.

- 274 About fourteen years of age this process is completed.
- 275 The Shedwing is effected by the absorption of the Fangs of the first set, and of their Sockets.
- 276 The Teeth are articulated to the Alveolar processes of the Jaws.
- 277 They are the direct instruments of Mastication, and are of essential use in pronunciation.

OS HYOIDES.

- 278 The Os Hyoides is placed horizontally between the root of the Tongue and the upper part of the Larynx.
- 279 It is divided into a Body, two Cornua, and two Appendices.
- 280 Its Body is horizontally somewhat obling, convex anteriorly, and concave posteriorly, its anterior convexity being divided by a middle horizontal ridge.
- 281 The Genio-Hyoides, and the Basio-Glossi, are inserted into the space above the ridge, the Mylo-Hyoidei and Stylo-Hyoidei into the ridge itself, and the Sterno-Hyoidei and Coraco-Hyoidei into the space below the ridge. The Membranes and Ligaments of the Tongue, Epiglottis and Thyroid Cartilage are fixed to its upper edge.
- 282 The Cornua are placed outward and backward from the body.
- 283 They have two flat sides which slope from above outward and downward; they diminish as they proceed backward, and terminate in round Tubercles.

Answ.

- 284 The Cerato-Glossus arises from the external surface of each cornu, and the Hyo-Thyroideus from its under edge. The Membranes of the Tongue and Larynx adhere to its posterior side, and from the Tubercle at the end of each a Ligament proceeds to the Cornua of the Os Hyoides.
- 285 The Appendices project upward from the junction of the body with the Cornua, and give attachment to
- 286 The Style-Hyoidei Alteri, the Condro-Glossi, and a Ligament to the Os Hyoides.
- 287 Except a point in the middle of its body, it is wholly Cartilaginous in the fatal state.
- 288 It is connected to the Styloid Processes, and Thyroid Cartilage by Ligaments.
- 289 It forms a solid point for the insertion and action of the Muscles of the Organs of Speech and Deglutition.

SECTION VII.

OF THE BONES OF THE TRUNK.

The Trunk of the Skeleton is divided into the Spine, Thorax, and Pelvis...

BONES OF THE SPINE.

VERTEBRÆ.

2 THE SPINE is situated along the posterior part of the Trunk:

Vol. II. E

- 3 It resembles a long, slender Pyramid, formed of a long chain of Bones superiorly, and a short one inferiorly, joined by their bases.
- 4 It is divided into the Vertebræ, Os Sacrum, and Os Cocceygis.
- 5 There are twenty-four true Vertebræ.
- These are subdivided into three classes, namely, into those of the Neck, or Cervical; those of the Back, or Dorsal; and those of the Loins or Lumbar Vertebræ.
- 7 Each Vertebra has a body, a bony ring, and seven processes.
- 3 The Body is placed anteriorly, and represents a portion of a Cylinder cut transversely, which is somewhat round. anteriorly, and sloped posteriorly.
- 9 Each Vertebra has seven Processes;
- superior, and two inferior; three serve the purpose of muscular attachment, of which two, from their situation, are called transverse, and one spinous.
- 11 The Ring is situated immediately behind the body, and within the processes.
- 12 The Vertebral Canal is formed by their conjunction.
- 13 The oblique, or articular Processes are situated above and below the posterior part of the body.
- 14 The Transverse Processes are situated at the sides of the Ring.
- 15 The Spinous Processes at the back of the Ring.
- 16 On each side, between the Body and Ring, there are

Answ.

Notches, two being situated superiorly, and two infe-

- 17 When two Vertebræ are joined, these notches form holes which serve to transmit the Intercostal Nerves.
- 18 The Vertebræ are of a spongy texture.
- 19 They are connected to each other by their bodies and by their articular processes.

CERVICAL VERTEBRÆ.

- 20 The Body of a Vertebra of the Neck is flatted anteriorly, and is thinner than the other Vertebræ; its upper side is concave from side to side, and its lower hollowed from before backward.
- 21 The Spinous Processes are more straight and forked at the extremity.
- 22 The Transverse Processes are very short, slightly bifurcated and perforated perpendicularly at their bases, they are also grooved in the upper side.
- 23 The Oblique Processes are more oblique, their cartilaginous sides in the upper ones being turned backward and upward, in the inferior ones forward and downward.

ATLAS.

- 24 The first Vertebra is called ATLAS.
- 25 It has no Body nor Spinous Process.
- 26 Its Ring is much larger than those of the rest.

- 27 It has an anterior and a posterior arch.
 - 28 To the posterior side of its anterior arch the toothlike Process of the second Vertebra is united.
 - 29 Its Transverse Processes are longer than those of the rest, and terminate in an obtuse point.
 - and form oblong horizontal Cavities, of which the anterior extremities are nearest.
 - 31 The Inferior Articular Processes are round, broad, and sloped inward.
 - 32 A long groove is seen immediately behind the Superior Articular Process.
 - 33 The Transverse Ligament of the toothlike Process is fixed to a Tuberosity on the inner side of its anterior arch.
 - 34 Its Lateral Ligaments are fixed to the inner side of the arch, external to the Transverse Ligament.
 - 35 The Second Cervical Fertebra is called Fertebra Dentota:
 - 36 Its Body is narrower and longer, and has upon its upper part a pivot, or axis, called Odontoides, or I'ens.
 - 37 The posterior part of the Processus Odontoides is marked by its Transverse Ligament.
 - 38 From its Apex the perpendicular Ligament arises.
 - 39 Nearly from its Apex, on each side of the perpendicular Ligament, arise the lateral Ligaments.
 - 40 Its Spinous Process is short, broad, and much forked, its lower side is hollowed by an angular cavity, and divided into two lateral parts by a bony line.
 - 41 Its Transverse Processes are very short, slightly turned downward, and perforated obliquely.

Answ.

42 Its Superior Articular Processes are very large, a little convex, placed nearly horizontally on each side of the toothlike Process.

LAST CERVICAL VERTEBRA.

- 43 The Body of the LAST CERVICAL VERTEBRA is the largest of this Class; its lower side is nearly flat.
- 44 Its Spinous Process is larger than those of the rest.
- 45 Its Transverse Processes are longer, placed farther back, and less grooved; their Foramina also are sometimes double.

DORSAL VERTEBRÆ.

- The Bodies of the DORSAL VERTEBRE are the most convex anteriorly, their upper and lower surfaces are nearly flat, and on each side there are two little articular surfaces, one above and one below to receive the heads of the Ribs.
- 47 The Spinous Processes are long and sharp superiorly; slightly hollowed inferiorly, and considerably inclined downward.
- 48 The Articular Processes are placed almost directly above and below the Transverse, and are perpendicular rather than oblique; the sides of the superior ones are slightly convex and turned backward, those of the inferior the reverse.
- 49 The Transverse Processes are directed obliquely backwards and downwards, they are pretty long superiorly, but

Answ.

diminish as they descend, those of the twelfth being very small; the anterior part of their tips are Cartilaginous and receive the Tubercles of the Ribs; these depressions diminish as they descend, and do not exist in the two last.

- 50 The Rings become rounder and narrower as they descend from the first to the tenth, where they again begin to be more flat.
- 51 The four first are somewhat flatted anteriorly.
- 52 Of the last two the Transverse Processes have no articular depression.

LUMBAR VERTEBRÆ.

- 53 The Bodies of the LUMBAR VERTEBRE are by much the largest, they are somewhat contracted about the middle, and their edges are prominent.
- 54 The Spinous Processes are short, straight, and broad on each side, but narrow above and below, that of the last being shorter and narrower than that of the rest.
- 55 The Transverse Processes are longer and more slender, being flatted anteriorly and posteriorly; they increase in length from the first to the third, then diminish to the fifth,
- 56 The Superior Articular Processes are concave lengthwise, the inferior convex lengthwise, and nearer each other than the superior, their convex articulating surfaces being turned outward from each other.
- 57 The Rings are flatted anteriorly, and angular posteriorly.

OS SACRUM.

- 58 The Os Sacrum is placed at the posterior and lower part of the Trunk, below the true Vertebræ.
- 59 It resembles a Pyramid with the basis upward, and apex downward; having an anterior, or concave side; a posterior, or convex one, and two edges.
- 60 It consists of *five portions*, the points of separation between which are marked by prominent lines in the adult.
- 61 Immediately behind its body is a small Canal, the form of which
- 62 Is triangular.
- 63 Four pairs of holes open anteriorly from it.
- 64 And posteriorly the same number as anteriorly.
- 65 The great Sacral Nerves pass out through the Anterior
- 66 It has two articular Processes placed at its base, immediately behind its body.
- 67 The lateral parts are large and broad superiorly; they form an uneven narrow surface as they descend.
- 68 They have on each side a large articulating surface for its union with the Ossa Inominata.
- 69 It is connected laterally to the Ossa Inominata, superiorly to the last Lumbar Vertebra, and inferiorly to the Os Coccygis.

OS COCCYGIS.

Answ.

- 70 The Os Coccygis is placed immediately below the Os Sacrum.
- 71 In form it consideraby resembles the Os Sacrum.
- 72 It consists of four or five pieces.
- 73 It has two Processes, one on each side of its upper portion which have been called its Cornua or Shoulders.

BONES OF THE THORAX.

74 THE THORAX consists of the Dorsal Vertebræ posteriorly, the Ribs laterally, and Sternum anteriorly.

RIBS.

- 75 THE RIBS are placed transversely and obliquely on each side of the Thorax.
- 76 They are bony arches of different sizes.
- 77 Twenty four in number, twelve on each side.
- 78 They are divided into two classes, viz. the true and the false Ribs.
- 79 The Seven Superior Ribs are called True, the Five Inferior, False.
- 80 Each Rib is divided into the middle part or body, an anterior and a posterior extremity, the external or convex, and the internal or concave side, a superior and an inferior edge.

- 81 The posterior extremity of the Rib which is turned toward the Vertebræ, is called the Head.
- 82 Immediately below the head, the Neck is situated
- 83 At a little distance from the head on the posterior side of the Rib, an articular eminence called the *Tubercle*, is seen.
- 84 At a little distance from the Tubercle, the bone forms
 a sudden bend called the Angle.
- 85 Its superior edge is rounded.
- 86 The Inferior edge is sharp, owing to a groove which runs along its inside and contains
- 87 The Intercostal, Artery, Vein and Nerve,
- 88 This Groove is most strongly marked about the middle, because at the head of the Rib the Vessels have not yet joined it, and at its anterior extremity they have separated from it.
- 59 The Head in general has two Cartilaginous surfaces to articulate with the little cavities formed by the union of the Dorsal Vertebræ with each other.
- 90 A cartilaginous surface is seen on each Tubercle, by which it is joined
- 91 To the transverse process of the Vertelræ above it.
- 92 In the first Rib the angle is not distinct from the Tubercle; in the second it is at a small distance, and thence continues to increase to the third false rib.
- those of the inferior false ribs generally enlarged, and both have a small concave depression to receive their Cartilaginous Elongations.

- 94 They increase in length as they descend to the seventh or eighth.
- 95 The anterior extremity of each Rib is lower than the posterior.
- 96 The back part of each rib is most curved.
- 97 The third false Rib and those immediately above it are most contorted.
- 98 The Anterior Extremities of the False Ribs are considerably the smallest.
- The First Rib differs from the rest, in being placed horizontally, in having its head connected only to one Vertebra; having no groove on its inferior edge, and being directly connected to the Sternum.
- Vertebra only; they have no connected each to one transverse processes, and no groove on their inferior edge.
- 101 The Superior Ribs have the shortest Cartilages.
- 102 The last true and first false Ribs have the longest Cartilages.
- 103 The Cartilages all bend forward, inward, and upward.
- 104 The seven true Ribs have their Cartilages fastened directly to the Sternum.
- 105 The Cartilages of the three superior false Ribs rest on those of the Ribs above merely.
- are unconnected, and on this account they have been called floating Ribs.

STERNUM.

- 107 THE STERNUM forms the anterior and middle part of the Thorax.
- 108 It somewhat resembles a dagger.
- 109 It consists of three portions.
- 110 The Superior Portion is broad and thick superiorly, thinner and narrower below, nearly resembling a triangle with the three angles cut off.
- 111 The Superior Edge of the upper portion is excavated to admit the trachea in great flexions of the head.
- 112 Its Superior Angles are depressed to receive the Clavicles.
- 113 Each of the lateral edges have one depression and a half, to lodge the anterior extremity of the first, and half of the second rib.
- 114. The Second Portion is flatter on both sides and broader.
 below than above.
- 115. Part, of the Pectoral Muscle is attached to the outside of the middle portion;
- 116 The Mediastinum and Triangularis Sterni to its inside.
- 117 Five whole and two half depressions, are seen on each side of the middle portion,
- 118 These lodge half the anterior extremity of the second, all the third, fourth, fifth, sixth, and half the seventh.

Answ.

- 119 The Third Portion is somewhat Cordiform.
- 120 At the upper part of each edge there is a half depression for the seventh Rib.
- 121 Its Structure is cellular.

BONES OF THE PELVIS.

- 192 THE PELVIS is situated at the lower part of the Trunk.
- 123 It represents a kind of a Bason of no regular figure.
- 124 It's formed by the Os Sacrum posteriorly, Os Coccygis inferiorly, and Oss Innominata at its lateral and anterior parts.
- race Pack Os Innominatum is divided into three portions, namely the Os Ilium, Os Pubis, and Os Ischium; these are considered as separate bones, on account of their being easily separable in young subjects.

OS ILIUM.

- of the Os Innominatum.
- 127 It is of a triangular figure, its broad, flat sides are unequally convex and concave.
- 128 It is divided into the Crista, basis, anterior and posterior edge, and external and internal sides.
- 129 The Crista forms the upper thick edge of the Os Ilium, which is divided into
- 130 Its external and its internal Labrium.
- 131 The angular terminations of the Crista, are called the

- anterior superior, and posterior superior Spinous processes of the Os Ilium.
- 132 Fallopius's or Ponpart's Ligament, and the Satorius

 Muscle are attached to the anterior superior Spinous

 Process.
- 135 About an inch below the anterior and at the same distance below the posterior superior processes are situated the anterior inferior and posterior superior spinous processes.
- 134 Its basis or inferior portion is the narrowest and thickest part.
- 135 The Ilium contributes to form the great Sacro Ischiatic notch posteriorly.
- 136 The Base forms part of the Acetabulum, or great Articular Cavity of the Os Innominatum, towards which
- 137 It contributes somewhat less than two-fifths.
- 138 The Aponeurosis Fascia Lata, the Latissimus dorsi, and Obliquus externus Abdominis are attached to the External Labium of the Crista, and posteriorly the Gluteus Maximus.
- The Gluteus Medius, occupies the space between the Crista, the attachment of the Gluteus Maximus and the great curved line, which extends on the Dorsum Ilii from the anterior superior spinous process to the Sciatic Notch.
- 140 The Gluteus Minimus is fixed to the space between the great curved line and the Acetabulum.
- 141 The Iliacus Internus is attached to the hollow on the inside of the bone.
- 142 There are two Articular surfaces corresponding to those

Answ.

of the Sacrum, at the posterior and internal part of the Ilium.

of this bone, forms part of the brim of the Pelvis, and distinguishes the cavity of the Pelvis from that of the Abdomen.

OS ISCHIUM.

- 144 The Os Ischium is situated at the lowest part of the Os Innominatum.
- 145 It is divided into a Body, a Tuberosity, and a Ramus.
- 146 From the posterior part of the body, its Spinous Process projects, to which are attached
- 147 The lessor Sacro Ischiatic Ligament, and the Coccygens internally.
- 148 The Tuberosity is situated at the lower and posterior part of the body, where the Ramus joins it.
- 149 From the Tuberosity arise the Quadratus Femoris externally, the Semimembranosits Semitendinosus and Biceps about its middle part, the great head of the Triceps from its inferior part, the greater Sacro-Ischiatic Ligament is also attached to its inner part.
- 150 The Ramus ascends forward from the Tuberosity.
- 151 By a very considerable Notch anteriorly it contributes to form the Obturator Foramen. A Notch posteriorly between the Tuberosity and Spine for the Obturator Muscle, one Laterally between the Tuberosity and

Answ.

Acetabulum for the Obturator Externus, and one exteriorly at the edge of the Acetabulum for Ligaments Vessels, and Fat are also noticed.

OS PUBIS.

- 152 THE Os Pubis is situated at the anterior part of the Pelvis.
- 153 It is divided into its body, angle and branch.
- 154 Its body forms its upper part, situated before the bases of the Os Ilium.
- 155 It contributes one-fifth to the formation of acetabulum.
- 156 A line on the inner side of its body, forms part of the brim of the Pelvis.
- 157 The Spine is situated about an inch from the angle;
- 158 It gives attachment to Poupart's Ligament, and in parts to the Rectus and Pyramidalis abdominis.
- 159 This bone forms part of the Obturator Foramen.
- 160 Its angle is situated anteriorly formed by the junction of the Body and Ramus.
- 161 The Ramus descend from its angle.

ACETABULUM:

- 162 One-fifth of the Acetabulum is formed by the Os Pubis; rather more than two-fifths by the Os Ischium, and less than two-fifths by the Os Ilium.
- 163 The upper part of its brim is most prominent.

Sect. VIII. BONES OF THE UPPER EXTREMITIES:

Ausw.

- 164 Between its middle and its inferior Notch it is denuded of Cartilage;
- 165 This part contains a Ligament and Synovial Glands.
- 166 Toward its lower part there is a notch, which serves
- 167 To transmit certain Vessels, &c.
- Os Sacrum; Anteriorly to its fellow, forming the Symphisis Pubis; and Laterally and Inferiorly to the thigh bone.

SECTION" VIII.

OF THE BONES OF THE UPPER EXTREMITIES.

The Bones of the Upper Extremities are divided intofour Classes, namely, those of the Shoulder, the Arm, the Forearm; and the Hand.

BONES OF THE SHOULDER.

2 The Shoulder consists of two, namely, the Scapula, and Clavicle.

SCAPULA.

3 The Scapula is placed laterally at the upper and posterior part of the Thorax, from about the first to the seventh Rib.

- 4 It is somewhat triangular.
 - 5 Its Regions are an external or posterior and convex side; an internal or anterior and concave side; three edges, of which one is named the basis; and two Costa, a superior and inferior; three angles, one anterior called the Neck, one superior, and one inferior.
- 6 The Base is the longest and thin edge turned towards the Spine; its upper part being nearer the Vertebræ than the lower.
 - 7 The Superior Costa is situated almost transversely between the superior point of the base and the neck of the Scapula, being most raised toward the base.
 - 8 At the Anterior part of the Superior Costa, a Notch may be seen.
 - 9 The Supra Scapular Vessels and Nerves pass through it.
- 10 The Inferior Costa is situated obliquely between the inferior point of the base and the Neck of the Scapula.
- 11 Its inferior edge or Costa is by much the thickest.
- 12 The Neck forms the anterior angle, and is surmounted,
- 13 By a Glenoid Cavity.
 - 14 The Coracoid Process rises immediately behind and above the neck.
 - 15 The Coraco-Clavicular and Coraco-Acromial ligaments are attached to this process and its Tuberosity.
 - 16 Three Muscles arise from its Tip, namely, the Pecter Vol. II.

- ralis minor internally, the Coraco Brachialis, and the short head of the Biceps.
- 17 The long head of the Biceps arises from above the Glenoid Cavity.
- 18 The Dorsum of the Scapula is unequally convex, divided into two by,
- 19 The Spine of the Scapula, a large process rising from the Dorsum.
- 20 The Trapezius is attached to the superior edge of this Spine.
- 21 The Deltoid to its inferior edge.
- 22 The Acromion is the name given to the most projecting part of the Spine;
- 23 It is broad and flat.
- 24 The Scapular end of the Clavicle is articulated with its upper edge near its Apex.
- 25 The Deltoid arises from its inferior and anterior edge.
- 26 The Spine divides the Dorsom Scapula into the Supra-Spinal and Infra Spinal Fossæ.
- 27 'The Infra Spinal Fossa is the largest.
- 28 The Supra Spinatus occupies the Supra Spinal Fossa.
- 29 The Infra Spinatus is fixed in the Infra Spinal Fossa.
- 30 The Teres Minor arises from the Groove on the inferior Costa.
- 31 The Teres Major arises from the flat surface on the outside of the inferior angle.
- 32 The Latissimus Dorsi only passes over this angle.
- 33 The Inner Side of this Bone is irregularly concave.
- 84 The Subscapularis Muscle is lodged in it.

Answ.

- 35 The Thicker parts of this bone possess a Diploe, the thin parts have not any, and are transparent.
- 36 It is connected to the Clavicle by the Acromion and to the Os Humeri by the Glenoid Cavity.

CLAVICLE.

- 37 The CLAVICLE is placed transversely and somewhat obliquely at the upper and anterior part of the Thorax, between the Scapula and the Sternum.
- 38 It has a considerable resemblance to an Italic S.
- 39 It is divided into a body and an internal or Sternal, and an external or Scapular Extremity.
- 40 Its Sternal Extremity is somewhat triangular; into its posterior angle is fixed
- 41 The Inter-clavicular Ligament.
- 42 The Tubercle, at the posterior part, near the Scapular Extremity, is connected by a Strong Ligament, with the Coracoid process of the Scapula.
- 43 The Scapular Extremity is flat and broad; from its anterior edge arises
- 44 The Deltoid, whilst
 - 45 The Trapezius is attached to its posterior edge.
- 46 The Pectoralis Major is attached to the anterior edge of the inner half of the Clavicle.
- 47 The Subclavius arises from the underside of the bone.
- 48 Its extremities are cellular, while its middle, having

Answ.

thick sides, possesses a narrow Cavity, filled with bony Filaments.

49 It is connected internally to the first bone of the Sternum, and externally to the Acromion.

OS HUMERI.

- 50 The Os Humeri is placed under the Acromion, along the side of the Thorax.
- 51 It is irregularly Cylindrical.
- 52 Divided into a body, a superior an inferior extremity.
- 53 Its upper Extremity is formed by a smooth round head, inclined obliquely inward.
- 54 Externally and somewhat inferiorly to the head there are two rough Tuberosities.
- 55 One called the internal or small, the other, the external or great Tuberosity.
- 56 The Subscapularis is inserted into the internal Tuberosity.
- 57 The Supra-Spinatus, Infra-Spinatus, and Teres Minor, are inserted into the external Tuberosity.
- 58 A considerable groove separates these Tuberosities which receives
- 59 The tendon of the long head of the Biceps.
- 60 The slight circular depression immediately below its head, is called the Neck.
- 61 The internal head of the Triceps begins at the posterior part of the Neck.
- 62 The Pectoralis Major is attached to the external ridge; and

- 63 The Latissimus Dorsi and Teres Major to the internal Ridge of the Bicipital Groove.
- 64 The Deltoid is attached to the great rough muscular mark, five inches below the external Tuberosity.
- 65 The Coraco Brachialis is attached to a ridge on the inner side of the middle of the bone.
- 66 The Medullary Artery enters about the middle of the anterior side of the bone, and slants downward.
- 67 The lower extremity becomes gradually flatter and broader than the rest of this bone, having an outer and an inner edge which terminate in two processes, called,
- 68 The outer and inner Condyles.
- 69 The inner Condyle is the largest and most projecting.
- 70 The Extensors and Supinators of the Hand arise from the external Condyle.
- 71 The Flexors and Pronators of the Hand from the internat Condyle.
- 72 Between and somewhat below the two Condyles; the Trochlea is situated;
- 73 It is an oblique, pully-like articular Surface, its inner edge is the most prominent; a small round articular head is placed between it and the outer Condyle.
- 74 Above these Parts there are two slight depressions Anteriorly, and a very considerable one posteriorly.
- 75 The posterior one receives the Olecranon, when the arm is extended; the inner anterior one receives the Coronoid Process of the Ulna, and the outer anterior one receives the round head of the Radius in the Flexions of the Foramen.

Answ.

- 76 In its natural situation, the hemispherical head of this bone is turned inward and backward; the great Tuberosity, outward and forward; the groove between the two Tuberosities directly forward; the external Condyle forward and outward, and the inner Condyle backward and inward.
- 77 The extremities of this bone are cellular, but the middle has a Tubular cavity, and several bony Filaments passing across it.
- 78 It is connected superiorly with the Glenoid Cavity of the Scapula, and inferiorly with the Ulna by its Trochlea, and with the Radius by its little round head.

BONES OF THE FOREARM.

79 The Forearm consists of two Bones, namely, the Ulna and the Radius.

ULNA.

- 80 THE ULNA is situated in the inner side of the Forearm.
- 81 It is a cylindrical bone, in its circumference irregularly triangular.
- 82 It is divided into a Body, and two Extremities.
- 83 The Olecranon and Coronoid Processes are its chief Eminences.
- 84 The Olecranon forms the upper Extremity of this bone, to which is attached
- 35 The Triceps extensor Cubiti.

- so The Coronold Process is situated on the anterior part of the bone somewhat lower than the former; this gives attachment to
- 87 The Brachialis Internus.
- 38 When the Forearm is extended, the Olecranon is lodged in the posterior depression of the inferior end of the Os Humeri.
- so During the Flexion of the forearm, the Coronoid process is lodged in the Anterior and inner depression of the lower end of the Os Humeri.
- on The Triangular Surface, on the posterior part of the Olecranon, forms the part of the Elbow on which we rest; and in the depression on the outer side of this is lodged.
- 91 The Anconeus.
- 92 The Great Sigmoid Cavity is the articular Surface formed between the Olecranon and Coronoid Process.
- 93 It articulates with the Trochlea of the Os Humeri.
- 94 The lesser Sigmoid Cavity is situated on the outside of the root of the Coronoid Process;
- 95 It receives the round kead of the Radius.
- 96 The Body of the Bone is Triangular.
- 97 The Interesseus Ligament is attached to its outer sharp edge.
- 98 The Canal for the medullary artery is placed about the middle of the anterior part of the bone, and slants upward.
- 99 The Inferior Extremity of this bone has a small head ex-

Answ.

ternally, and a Styloid Process internally; the latter gives attachment to

- 100 A Ligament from the Os Pisiforme.
- 101 The *Ulnar Artery* and Nerve pass immediately *before*; whilst
- 102 The Tendon of the Extensor Carpi Ulnaris passes behind this lower Extremity.
- 103 Its structure resembles that of the Os Humeri.
- 104 It is connected superiorly with the Pully of the Os Humeri: laterally with the two extremities of the Radius and with the hand inferiorly.

RADIUS.

- 105 THE RADIUS is placed on the outer side of the Forearm.
- 106 It is a cylindrical bone irregularly triangular.
- 107 The Radius is shorter than the Ulna.
- 108 It is divided into head, body, and basis:
- 109 The upper part of the head is concave, for connection with the small round head of the Os Humeri; and its circumference is Cylindrical for its articulation
- 110 With the lesser Sigmoid Cavity of the Ulna.
- 111 The Neck is situated immediately below the Head, and its direction is somewhat oblique.
- 112 The Tuberosity is situated on the inner and anterior side, immediately below the neck, to which is attached,
- 113 The Biceps Flexor Cubiti.

Answ.

- 114 Its Body is somewhat Triangular.
- 115 The Interosseus Ligament is attached to its inner sharp Edge.
- 116 The Medullary Artery enters about the middle of the anterior side of the Bone and slants upward.
- 117 The Inferior Extremity is the largest.
- 118 Its greatest diameter is from side to side.
- 119 Anteriorly it is uniform and somewhat hollowed for the passage of the Flexor Tendons.
- 120 It has a semilunar depression on its inner side for the Inferior head of the Ulna.
- 121 The Extensor Tendons are lodged in grooves on its posterior side.
- 122 On the outer side of its inferior end it has a Styloid Process, to which is fixed,
- 123 A Ligament, connecting it to the Trapezium.
- 124 Its structure resembles that of the other long bones.
- 125 It is joined superiorly to the Os Humeri, laterally to loth ends of the Radius, and inferiorly to the Bones of the Carpus.

BONES OF THE HAND.

126 The Hand is divided into the Carpus, the Metacarpus, and the Fingers.

CARPUS.

- 127 THE CARPUS forms the wrist and the base of the hand.
- 128 It consists of eight Bones.
- 129 It is convex externally, and concave internally, and is of an irregular quadrangular form.
- 130 The Bones are arranged in two rows, an upper and a lower row, four Bones in each row.
- 131 Those of the upper row are, the Os Scaphoides, Os Lunare, Os Cunciforme, Pisiforme; those of the lower row are, Os Trapezeum, Os Trapezoides, Os Magnum, and Os Unciforme.
- 132 The Os Scaphoides is the first, or most external Bone of the first row.
- and the whole Bone is oblong, bearing, as its name implies, some resemblance to a boat.
- 134 THE Os LUNARE is the second Bone of the first row.
- 135 It is convex superiorly; concave inferiorly. Its anterior and posterior surfaces are rough for the attachment of Ligaments.
- 136 THE OS CUNEIFORME is the third Bone of the first row.
- 137 Its upper surface is convex; its anterior surface has upon it an orbicular plane for the Os Pisiforme; it has also articular surfaces toward the Os Similunare, and the Os Unciforme.
- 138 The Os Pisiforme is the fourth Bone of the first row placed upon the anterior side of the Cuneiforme.

Answ.

139 It is irregularly round.

- 140 THE OS TRAPEZIUM is the first or external Bone of the second row.
- 141 It is irregularly square; its inner surface has upon it an oblong eminence for the Carpal Ligament, and a groove for the Tendon of the Flexor Longus Pollicis; its upper side is hollow for articulation with the Os Scaphoides; its lower side is connected with the first Bone of the Thumb; its outer surface is rough; and its inner side is connected, superiorly with the Os Trapezoides, and inferiorly with the first Bone of the Metacarpus.
- 142 THE OS TRAPEZOIDES is the second Bone of the second row; it is joined superiorly to the Os Scaphoides; inferiorly to the base of the first Metacarpal Bone; on its Radial side to the Os Trapezium; and on its Ulnar side to the Os Magnum.
- its superior side is round for connection with the Os Scaphoides, and Os Lunare; inferiorly it is joined to the second Metacarpal Bone, on its Radial side, to the Os Trapezoides; and on its Ulnar side to the Os Unciforme.
- 144 THE OS UNCIFORME is the fourth Bone of the second row.
- which the Carpal Ligament, and some Muscles of the little Finger arise; its posterior surface is rough for the attachment of Ligaments; its Radial side is double corresponding to the Ulnar side of the Os Mag-

Answ.

num; its superior side corresponds to the inferior one of the Os Cuneiforme; its inferior side is double for the last Bones of the Metacarpus.

146 The structure of these Bones is spongy.

METACARPUS.

- 147 THE METACARPUS is placed immediately below the Carpus.
- 148 It consists of four Bones, one supporting each Finger; some anatomists reckon five, considering the first Bone of the Thumb as a Metacarpal Bone.
- 149 They are long Bones, thicker at the extremities than at the middle.
- 150 Each may be divided into a basis, body, and head.
- 151 Their Bases are narrow toward the palm, broader toward the back of the Hand, and broadest on each side.
- 152 Their Bodies are contracted, of a triangular figure; posteriorly somewhat convex, for the back of the Hand; and anteriorly each has a sharp Ridge.
- 153 Their Heads are round Eminences flatted on each side; their greatest convexity is turned towards the Palm.
- 154 The first, which supports the Forefinger, is the longest.
- 155 Their structure resembles that of the long Bones.
- 156 They are connected superiorly to the Bones of the Carpus; laterally to each other by their bases; and inferiorly to the first Bones of the Fingers.

BONES OF THE FINGERS.

- 157 Each Finger is composed of three Bones; there are fifteen upon the whole, including those of the Thumb.
- Bones are called *Phalanges*; those nearest the Metacarpal Bones are called the *first*, and those which form the ends of the Fingers the third, or last.
- Bones of the Metacarpus, its convex side is much flatted, and broadest toward the head, which resembles the Metacarpal Bones. The articular surface of its base is a double Ginglimus, allowing Flexion and Extension, Adduction and Abduction, and corresponds to the lower side of the Os Trapezium.
- 160 The second Bone of the Thumb is shorter than the first, convex on one side, flat on the other, and contracted between the edges.
- 161 The base of the third Bone of the Thumb forms a Ginglimus with the head of the second Bone, and has very near it, on each side, a small Tuberosity. Its head is small and flat, and ending in a rough semicircular edge.
- 762 The first Phalanges of the Fingers somewhat resemble the second Bone of the Thumb, but they are longer, flatter anteriorly, and rounder posteriorly.
- 163 The second Phalanges of the Fingers are shorter, nar-

Answ.

rower, and thinner than those of the first; their lases have a double cavity for a Ginglimoid Articulation.

Thumb, except that their size is proportioned to their respective Fingers.

SECTION IX.

OF THE BONES OF THE LOWER EXTREMITIES.

Each Lower Extremity is divided into the Thigh, Leg, and Foot; one Bone forms the Thigh, called,

OS FEMORIS.

2 THE Os FEMORIS is placed nearly in the same direction with the Trunk, only bends somewhat inward.

3 It is divided into its body, a superior and inferior Extre-

mity.

4 At the upper Extremity the head is situated, which resembles a large portion of a Ball, supported by its long neck.

5 It is turned obliquely inward and a little forward, forming an Angle with the body.

There is an irregular Fossula in the head, a little below

its centre to which is attached

7 A strong Ligament, called the Ligamentum Teres.

The Neck is placed at the upper part of the Bone;

- 9 It is inclined upward and slightly forward, supporting the head.
- 10 Around the root of the neck the Capsular Ligament is attached.
- 11 Trochanter Major is the name given to the great Tuberosity at the root of the neck; and which is
- 12 Situated at its outer side;
- 13 Its external convex Surface is covered by the tendon of the Gluteus Maximus.
- 14 The Gluteus Minimus is attached to the rough broad inregular mark anteriorly.
- To its long posterior edge the quadratus femoris is attached.
- Medius posteriorly, and to the Pyriformis, Obturator internus, and gemini anteriorly.
- 17 In its fossæ is attached the tendon of the Obturator externus.
- 18 The body of this bone is Cylindrical.
- 19 At the inner and posterior part of the root of the neck the Trochanter Major is situated, to which are attached,
- 20 The Iliacus Internus and Psoas Muscles.
- 21 The rough prominent line passing along the Posterior part of the Os Fermoris, is called Linea Aspera.
- 22 The Glutwus Maximus is attached to its commencement at the root of the great Trochanter.
- 23 The Triceps is inserted into its middle, and the short head of the Biceps arises from it,

- 24 Below it divides into two Ridges, one of which passes externally and the other internally.
- 25 The Vastus Externus is attached to the outer ridge.
- 26 The Vastus Internus, and the Aponeurosis of the great head of the Triceps to the inner ridge.
- 27 The Femoral vessels pass over the internal one; this is terminated by a Tuberosity, into which is inserted,
- 28 The Tendon of the great head of the Triceps.
- 29 The Canal for the Medullary Artery is placed about the middle of the Linea Aspera, and slants upward.
- 30 The lower Extremity is broad and thick, formed of two large protuberances projecting downward and backward, called,
- 31 The Condyles of the Os Femoris.
- 32 The inner Condyle projecting most posteriorly and inferiorly.
- 33 The outer Condyle is more prominent anteriorly.
- 34 A deep Notch separates the Condyles posteriorly.
- 35 Through which the Vessels pass from the Arm.
- 36 The Crucial Ligaments are attached to the sides of this Notch.
- 37 The junction of the Condyles anteriorly forms a pullylike Surface on which the Patella rests.
- 38 The heads of the Gastrocnemius are attached just above the posterior terminations of the Condyles.
- 39 Its structure resembles that of the other long bones.
- 40 It is connected to the Os Inominatum superiorly, and to the Tibria inferiorly.

BONES OF THE LEG.

Answ.

41 The Leg consists of three Bones, namely the Tibia, Fibula, and Patella.

TIBIA.

- 42 THE TIBIA is situated on the inner side of the Leg.
- 43 Its circumference is irregularly triangular; it is larger above than below.
- 44 It is divided into a Body, an upper and a lower Extremity.
- 45 Its thick expanded superior Extremity, which has been called its head, presents two broad articular surfaces, one placed externally, the other internally, nearly horizontal and slightly hollowed: of these,
- 46 The internal one is somewhat oblong and depressed, the external one is rounder.
- 47 Between them there is a rough tuberosity, to which the crucial ligaments are attached.
- 48 The Simimembranosus is inserted into a tuberosity at the posterior and interior part of the head.
- 49 The head of the Fibula is articulated with the tuberosity behind the outer part of the head.
- 50 The Ligament of the Patella is attached to the tuberosity at its forepart.
- 51 The body presents three distinct surfaces and edges.
 Vol. II. G

Answ.

- 52 The Interosseus Ligament is attached to the inner edge.
- 53 The Medullary Canal is situated some way above the middle of the posterior side of the bone, and slants downward.
- 54 The lower Extremity is much smaller than the upper.
- 55 On its outer side there is a longitudinal depression for the end of the Fibula.
- 56 On its inside a process called the Malleolus Internus, which gives attachment to a strong ligament.
- 57 The lower end of the Tibia and its Malleolus Internus, together with the lower end of the Fibula, or the Malleolus Externus, form a Trochlea, or pully-like cavity, in which plays the first bone of the foot.
- This Bone is joined superiorly to the Os Femoris and Patella; laterally to the Tibia both above and below, and inferiorly to the Astragalus.

PATELLA.

- THE PATELLA is situated directly above the anterior Tuberosity of the Tibia.
- oo It is about half as thick as it is long, but its length and breadth are nearly equal.
- 61 It is divided into a Basis, an Apex, and two Sides.
- 62 The Base, which is turned upward, gives attachment to the union of the Vasti, Rectus Femoris, and Cruralis.
- 63 The Ligament of the Patella is fixed to the Apex.

Answ.

- 64 Its inner or posterior side is somewhat concave, and divided into two by a middle ridge.
- 65 Of these the deepest cavity is the most external.
- 66 It is of a spungy structure.
- 67 It is connected to the anterior Tuberosity of the Tibia by a strong ligament, and is articulated with the pully and condyles of the Femur.

FIBULA.

- 68 THE FIBULA is placed on the outside of the Leg.
- 69 It is a long slender Bone, having three surfaces, and edges which are contorted in their course.
- 70 It is divided into a body, an upper and a lower extremity.
- 71 The upper Extremity, or Head, is obliquely flatted by a small articular Plane internally, and has upon its outer side a small Tuberosity, to this is attached,
- 72 The Tendon of the Biceps and the external lateral Ligament.
- 73 The articular surface is connected with a similar one on the Tibia.
- 74 The circumference of the body is irregularly triangular.
- 75 There is on the inner side a sharp line to which the Interosseus Ligament is attached.
- 76 The Canal for the Medullary Artery, is placed about the middle of the posterior side of the bone, and slants downwards.
- 77 The lower extremity of this bone is broader, flatter, and more oblong than the upper.

Answ.

- 78 The outer articular surface of the Astragalus is articulated with it.
- 79 It is terminated by a tuberosity, to which a strong ligament is fixed.
- 80 It is connected laterally to the Fibula, both above and below, and inferiorly to the Astragalus.

BONES OF THE FOOT.

81 The Bones of the Foot are arranged under three classes, namely, those of the Tarsus, Metatarsus, and Toes.

TARSUS.

- 82 THE TARSUS forms the posterior part of the Foot.
- 83 It consists of seven bones, namely, the Astragalus, Os Calcis, Os Scaphoides, Os Cuboides, and the three Ossa Cuneiformea, the Internum, Medium, and Externum.
- 84 The Astragalus is the most superior, and, with the bones of the leg, forms the Ancle Joint.
- 85 It is extremely irregular, but may be divided into a body, or posterior portion, and an Apophysis or Anterior Portion.
- 86 Its superior articular surface resembles half a pully.
- 87 Its inferior surface is divided into two articular facettes by a deep transverse groove.
- **58** These articular surfaces are united to corresponding ones on the Os Calcis.
- 89 The anterior articular surface is round and prominent, it

- has been called the head of this bone, and is articulated with the Os Naviculare.
- of the Tarsus, forms the heel.
- 91 It is of an irregular oblong form.
- 92 The superior surface is divided by a groove, which separates two articular surfaces, for its union with the Astragalus.
- 93 It is broad, unequally convex, and rough posteriorly.
- 94 The Tendo Achilles is attached to this roughness.
- 95 It is narrow and rough inferiorly.
- 96 It has a concave articular surface anteriorly, by which it is joined to
- 97 The Os Cuboides.
- 98 It is very rough and broad externally.
- 99 It is considerably concave internally for the lodgment of
- 100 Several Muscles and Tendons as well as many vessels and nerves going to the Foot.
- 101 The Os Scaphoides is placed immediately before the Astragalus.
- 102 As its name implies, it somewhat resembles a small boat, and has an anterior, and a posterior cartilaginous surface; an oval circumference, and an inferior Tuberosity.
- 103 The head of the Astragalus is lodged in the posterior concave side.
- 104 The three Ossa Cuneiformia are articulated with its anterior convex side.
- 105 The Tuberosity, turned inwards and downward, gives

Answ.

attachment to a portion of the Abductor Pollicis, and Tibialis anticus.

- 106 The Os Cuboides is situated before the Os Calcis on the outside of the Os Naviculare.
- 107 It has six irregular sides.
- 108 Its inferior surface is rough; before an oblique eminence there is a well-marked groove which lodges,
- 109 The Tendons of the Peroneus Longus.
- 110 The posterior side is articular, and formed to adapt itself to
- 111 The anterior part of the Os Calcis.
- into two portions by a narrow faint line; it is articulated with,
- 113 The fourth and fifth bones of the Metatarsus.
- 114 Its inner side has upon it a round cartilaginous surface, and the rest of it is rough.
- 115 The Os Cunciforme Externum is articulated with it.
- 116 The outer side is irregular, short, and narrow.
- 117 The upper side is flat and rough for the attachment of Ligaments.
- The Ossa Cuneiformia are situated before the Os Scaphoides, and internal to the Os Cuboides.
- 119 The internal is the largest, the external the least.
- 120 Each Cuneiform bone has a lase superiorly, an apex inferiorly, and a posterior, an anterior, an external, and an internal side.
- 121 The Os Cuneiforme Internum somewhat resembles a

Answ.

wedge contorted and bent, and has its base turned downward.

- 122 The Os Cuneiforme Medium has more resemblance to a wedge, and has its base upward.
- 123 The Us Cuneiforme Externum also resembles a wedge, and has its base upward.

METATARSUS.

- 124 THE METATARSUS forms the middle part of the foot.
- 125 It consists of five bones, one supporting each Toe.
- 126 They are longer and more slender than the Metacarpal Bones.
- 127 Each may be divided into a body, basis, and head.
- 128 Their lases resemble a wedge whose edges are turned downward.
- 129 The bodies are long and slender, and flatted on each side.
- 130 Their heads or anterior Extremities, are convex and smooth, much flattened laterally, and are joined to the Toes.
- 131 The first of the Metacarpal Bones is by much the
- 132 The fifth is distinguished by a rough projection from its base; to which is attached the peroneus brevis.
- 133 They are joined to the Tarsus, and to each other posteriorly, and to the first Phalanges of the fingers anteriorly.

Sect. X. OF THE FEMALE SKELETON.

BONES OF THE TOES.

Answ.

- 134 The five Toes are formed by fourteen Bones; three belonging to each of the four lesser Toes, and two to the great Toe.
- 135 They are arranged as those of the Fingers.
- 136 The first bone of the great Toe somewhat resembles the second bone of the thumb; its base is considerably hollow, and its head resembles a pully.
- 137 The second Fone of the great Toe resembles the last of the thumb; but is much bigger, and its anterior edges more unequal.
- 138 The first bones of the other toes are the largest; but are shorter, narrower, and more convex than those of the fingers.
- 139 Their second bones are very short, and almost of the same oblong form.
- 140 Their third bones nearly resemble those of the fingers.
- 141 The small oval bones chiefly found under the first joint of the great toe are called Sessamoid Bones.

SECTION X.

FEMALE SKELETON.

1 The Bones of the Female are smaller and less strongly marked than those of the Male; all muscular attachments, depressions, and protuberances are smaller.

Sect. X. OF THE FEMALE SKELETON.

- 2 The Skull of the Female is said to be larger though more delicate.
- 3 The Sinuses of the Os Frontis are less capacious, and it is more frequently divided by a Suture down the middle.
- 14 The Clavicles are straighter.
 - 5 The Sternum is shorter and more elevated below.
 - 6 The Cartilages of the True Ribs are larger, broader and flatter to support the Mammæ.
 - 7 The Bodies of the Vertebræ are deeper.
 - 8 The Sacrum is broader and set more backward.
 - 9 The Os Coccygis is more moveable.
- 10 The Ossa Ilia are broader and more turned outward.
- 11 The arch of the Pubis and the Ischiatic notch are larger.
- 12 The Tuberosities of the Ischia are more distant and flatter.
- 13 The Ossa Femorum are more distant, and the angle of the neck with the body of the bone is greater.
- The Pelvis contains the most distinct Characters of difference between the Male and Female Skeleton.—In the Female, though the bones of the Pelvis are less massy and rough, the cavity they form is more capacious; the Ilia more expanded; the brim more rough and of an oval form, its greatest diameter being from side to side; the Outlet more expanded; the Arch of the Pubis greater; and the Tuberosities of the Ischia more distant from each other.

Sect. XI.

OF CARTILAGES.

CHONDROLOGY.

SECTION XI.

OF CARTILAGES.

- 1 Cartilages are white, elastic, smooth, and very compact substances, in density next to bone.
- 2 There are four kinds of Cartilage. 1. Diarthrodial Cartilages.
 2. Synarthrodial Cartilages. 3. Interarticular Cartilages. 4. Cartilages through life supplying the place of bone.
 - 3 DIARTHRODIAL Cartilages cover the ends of bones forming moveable joints.
 - 4 They afford a highly polished Surface favourable to the motions of the joint, and their elasticity renders violent movements less dangerous.
 - 5 SYNARTHRODIAL Cartilages are placed between several bones, having no perceptible motions on each other as the bones of the Pubis, &c.
 - 6 They answer the purpose of a bond of Union, and also prevent the ill effects of Shocks from sudden and violent motions.
 - 7 Interarticular Cartilages are placed in some joints between the hones, as in the joint of the Lower Jaw, the Clavicle with the Sternum, and the Knee joint.
 - 8 They prevent the ill effects of Friction, enlarge the articular Cavity, and extend the mobility of the joint.
 - 9 The Nose, the Larynx, Trochea, and part of the Chest have in part Cartilage supplying the place of Bone.

SYNDESMOLOGY.

SECTION XII.

OF THE LIGAMENTS OF THE HEAD AND TRUNK.

nsw.

- 1 Ligaments are strong, flexible substances, usually connecting those bones together, which form moveable joints.
- 2 There are two kinds of Ligaments, 1. The Capsular.
 2. The connecting Ligaments.
- 3 The Capsular Ligaments surround the joints on all sides.
- 4 They form bags, which retain, and probably secrete, the Synovia, whilst they contribute to the union of the bones.
- 5 The connecting Ligaments are usually of a firmer and more fibrous texture than the Capsular.
- 6 They strengthen considerably the union of bones.
- 7 They are called lateral, crucial, round, &c. according to their situations or form.
- body, some answering the purpose of bones, others strengthening the union of bones not moving on each other: these two kinds may be found about the Pelvis; a third kind are the Elastic Ligaments, they exist about the Vertebræ; in some animals they are very common, of this nature is the whiteleather in

Answ.

the neck of grazing animals, and the substance which supports the talons of animals of prey, &c. &c.

9 For the lower Jaw there are two ligaments on each side, viz. a capsular and a lateral one.

- of the Squamous Portion of the Temporal Bone, and, enclosing in its passage downward an interarticular Cartilage, is fixed round the Condyloid process of the lower Jaw.
- The lateral Ligament arises from the root of the Styloid process of the Temporal Bone, and is inserted into the inside of the angle of the lower Jaw.
- 12 For the union of the Vertebræ there are seven kinds of Ligaments, viz. the common anterior ligament, common posterior, crucial or intervertebral, the capsules of the oblique processes, intertransverse, subflava, and interspinous.
- of the first Vertebra, and covers the anterior part of the whole spinal column as far down as the Os Sacrum.
- 14 The common posterior Ligament arises from the anterior part of the Foramen Magnum, and covers the posterior part of the bodies of the Vertebræ to the termination of the Os Sacrum.
- 15 The crucial or intervertebral Ligaments cross each other obliquely from the edge of one Vetebra to that of another.

- 16 The Capsules of the oblique Processes arise from the edge of one oblique process, and surround that of another.
- 17 The intertransverse Ligaments pass between the transverse processes of the Vetebræ.
- 18 The Ligamenta Subflava connect the bony arches of the Vertebræ.
- 19 The Interspinous Ligament connect the Spinous processes of the Vertebræ.
- viz. the Ligamentum Nuchæ, common to all the Vertebræ of the Neck, and the Transverse Ligament belonging to the two first.
- 21 The Ligamentum Nuchæ arises from the Spine of the Occiput, and is attached to the Spinous processes of all the Cervical Vertebræ.
- 22 The Transverse Ligament of the Atlas is attached to a small Tuberosity, on each side of the articular depression behind the anterior arch of the Atlas, and encloses the Tooth-like process of the Dentatus.—It sends one process up to the Occiput, and another down to the inferior Vertebræ.
- pitis are four in number, being those of the Anterior and Posterior Arches of the Atlas and the Capsular Ligaments for the Condyles.
- 24 The Ligaments from the Second Vertebra to the Occiput are three in number, one Perpendicular and two lateral.
- 25 The Perpendicular Ligament arises from the tip of the

Answ.

tooth-like process of the second Vertebra, and is inserted into the edge of the Foramen Magnum between the Condyles.

- 26 The lateral Ligaments arise from each side of the Processus Denatus, and are inserted into the Occiputation before the Condyles, and also into the inside of the Atlas.
- 27 The Ligaments connecting the Ribs and Vertebræ are of six kinds, viz. the Capsular of the Heads of the Ribs, the Capsular of the Tubercles of the Ribs, the External Ligaments of the Necks of the Ribs, the Internal Ligaments of the Necks of the Ribs, the External Transverse Ligaments, and the Internal Transverse Ligaments.
- The Capsules of the heads of the Ribs surround their junction with the bodies of the Vertebræ.
- 29 The Capsules of the Tubercles surround their junction with the Transverse processes of the Vertebræ.
- of the Oblique processes, and are inserted into the necks of the Ribs.
- 24 The Internal Ligaments of the Necks arise from the lower edges of the Transverse processes, and are inserted into the internal part of the necks of the Ribs.
- Transverse process, and is inserted into the angle of each Rib.
- 23 The Internal Transverse Ligament arises from the body

- of each Vertebra, and is inserted anteriorly a little beyond the head of each Rib.
- 34 The Ligaments connecting the Ribs to each other are called Coruscating Ligaments, and pass between their Cartilages.
- 35 The Ligaments connecting the Ribs and Sternum are of two kinds, viz. Capsular Ligaments, and Transverse ones.
- 36 The Capsules of the Cartilages connect them to the depressions of the Steinum.
- 37 The External and Internal Transverse Ligaments externally and internally connect the Cartilages of the Ribs to the Sternum.
- 38 The Proper Ligaments of the Sternum are two, viz. the common Membrane of the Sternum, and the Ligaments of the Xiphoid Cartilage.
- Poupart's Ligament, the Annular Ligament, and the Obturator Ligament; posteriorly they are five, viz. the Transverse, the Ileo-Sacral, the Ligamenta Nuga, the short Ischiatic, and the long Ischiatic Ligament.
- 10 Poupart's Ligament arises from the anterior superior Spinous process of the Ilium, and is inserted into the angle of the Pubis. Some of its fibres are inserted into the Pubis before it reaches the angle, and it is these which are to be divided in Gimberant's Operation for Femoral Hernea.

- 41 The Annular Ligament surrounds the articulation of the Ossa Pubis.
- 42 The Obturator Ligament closes up the Foramen Thyroideum, leaving only a small notch at its superior part.
- 43 The Transverse Ligaments arise from the Transverse processes of the fourth and fifth Lumbar Vertebræ, and are inserted into posterior superior Spinous process of the Ilium.
- 44 The Ileo-Sacral Ligament arises from the superior posterior spine of the Ilium, and is inserted into the back of the Sacrum.
- 45 The Ligamenta Vaga are numerous small Ligaments which pass from the Ilium to the Sacrum anteriorly and posteriorly.
- 46 The Short Sacro-Ischiatic Ligament arises from the spine of the Ischium, and is inserted into the posterior part of the Transverse process of the Sacrum.
- 4? The Long Sacro-Ischiatic Ligament arises from the internal edge of the Tuberosity of the Ischium, and is inscreted along with the last.
- 48 The Ligaments of the Os Coccygis are four in number, viz. a Capsular, an Anterior, a Posterior, and a Lateral Ligament.

SECTION XIII.

OF THE LIGAMENTS OF THE UPPER EXTREMITY.

Answ.

- 1 The LIGAMENTS, connecting the Clavicle to the Sternum, are three in number, viz. the Capsular Ligament, the Interclavicular Ligament, and the Rhomboid Ligament.
- 2 The Capsular Ligament arises around the depression of the Sternum, and, involving an interarticular cartilage, is inserted around the end of the Clavicle.
- 3 The Interclavicular Ligament passes behind the Sternum from the end of one Clavicle to that of the other.
- 4 The Rhomboid, or Costo-Clavicular Ligament connects the first Rib and Clavicle near the Sternum.
- 5 The LIGAMENTS, connecting the Clavicle and Scapula, are three in number, viz. the Capsular, the Conoid, and the Trapezoid.
- The Capsular Ligament arises around the Sternal end of the Clavicle, and is fixed round the articular surface of the Acromion.
- 7 The Conoid or Coraco-Clavicular Ligament arises pointed from the root of the Coracoid process, and is inserted into the inferior side of this end of the Clavicle.
- 8 The Trapezoid Ligament differs in form from the last, but has nearly the same origin and insertion.
- The LIGAMENTS proper to the Scapula are two in number, viz. an Anterior and a Posterior.

Vol. II.

- 10 The Anterior arises from the upper edge of the Acromion, and is inserted into that of the Coracoid process, also called Coraco-Aeromial Ligament.
- 11 The Posterior arises from the root of the Coracoid process, and passes over the notch to the superior Costa of the bone.
- The LIGAMENTS, connecting the Scapula and Humerus, are two in number, viz. the Capsular and the upper part of the Tendon of the Biceps.
 - 13 The Capsular Ligament arises from the margin of the Glenoid Cavity, and is inserted round the neck of the Humerus.
 - The Tendon of the Biceps arises from the upper edge of the Glenoid Cavity, passes through the joint and, being fixed in its groove by a Strong Sheath, it contributes to strengthen the shoulder joint.
 - 15 The LIGAMENTS PROPER to the Humerus are two in number, viz. the External and the Internal Internuscular.
- 16 The External Intermuscular Ligament arises from the external Condyle, and is inserted into the middle of the outside of the bone.
- 17 The Internal Intermuscular Ligament arises from the Internal Condyle, and is inserted into the middle of the inside of the bone.
- The Humerus is connected to the Radius and Ulna by THREE LIGAMENTS, viz. the Capsular, and the External and Internal Lateral.
- 19 The Capsular Ligament arises round the Trochlea of the

Answ.

Humerus, and is inserted around the heads of the Radius and Ulna.

- 20 The External Lateral arises from the External Condyle of the Humerus, and is inserted into the outside of the neck of the Radius.
- 21 The Internal Lateral arises from the internal Condyle, and is inserted into the inner side of the Coronoid process of the Ulna.
- 22 The LIGAMENTS connecting the Radius and Ulna are four in number, viz. the Goronary, the Oblique, the Interosseous, and the Sacciform.
- 23 The Coronary arising from the Ulna, surrounds the head of the Radius.
- 24 The Oblique arises from the base of the Coronoid process of the Ulna, and is inserted into the tubercle of the Radius.
- 25 The Interosseous is attached to the acute edges of these Bones, turned towards each other.
- The Sacciform Ligament unites in a distinct articulation, the lower ends of the Radius and Ulna.
- 27 The LIGAMENTS connecting the Radius and Ulna to the Carpus are three in number, viz. the Capsular, the External, and the Internal Lateral. Between the end of the Ulna and the Os Naviculare, a triangular interarticular cartilage is placed.
- The Capsular Ligament arises around the lower articular surfaces of the Radius and Ulna, and is inserted round the three first bones of the Cappus.

- 29 The External lateral Ligament arises from the Styleid process of the Radius, and is inserted into the outside of the Os Scaphoides.
- 36 'The Internal lateral Ligament arises from the Styloid process of the Ulna, and is inserted into the outside of the Os Cunciforme and Os Unciforme.
- 31 The LIGAMENTS of the Carpus are of five kinds, viz. the Capsular, the Transverse, the Posterior Annular, the Anterior Annular, and the Vaginal.
- 32 The Capsular Ligament surrounds and connects all the Carpal Bones.
- 33 The Transverse, passing from one to another, tie the individual bones together.
- 34 The Posterior Annular binds down the tendons of the Extensor Muscles to the back of the Carpus.
- Os Unciforme, and is inserted into the Trapezium, under which pass the Flexor Tendons.
- 36 The Vaginal Ligaments proceed from within the anterior annular, and sheath the Flexor Tendons.
- 37 The LIGAMENTS connecting the Carpus to the bases of the Metacarpal bones are of four kinds, viz. the Capsular, the Lateral, the Dorsal, and the Palmar.
- 38 The Capsular Ligaments are derived from that of the Carpus, which includes the bases of these bones.
- 39 The Lateral are situated on each side the articulations.
- 40 The Dorsal are Transverse Ligaments, connecting the bases of these bones, on the back of the hand.

Answ.

- 41 The Palmar connect the bases of the Metacarpal Bones in the Palm.
- 42 The LIGAMENTS of the head of the Metacarpal bones are of three kinds, viz. Capsular, Lateral, and Transverse.
- 43 The LIGAMENTS connecting the Phalanges are at each
 Joint Capsular and Lateral.

SECTION XIV.

OF THE LIGAMENTS OF THE LOWER EXTREMITY.

- 1 Two LIGAMENTS connect the Os Femoris to the Os Innominatum, viz. a Capsular, and a Round Ligament.
- 2 The Capsular Ligament arises from the Margin of the Acetabulum, and is inserted around the root of the neck of the Femoral Bone; a reflected layer of this
 - Ligament passes up the neck to the edges of the head of the bone; and Transverse Ligaments connect the one layer with the other.
- 3 The Round Ligament arises from the small depression of the head of the Femur, and is inserted into the middle of the Acetabulum.
- 4 There are SIX LIGAMENTS which connect the Femur to the Tibia and Fibula, namely, the Capsular, Popliteal, Internal Lateral, External Lateral, Anterior Crucial, and Posterior Crucial.
- The Capsular Ligament passes from the edges of the articular surface of the Femur to those of the Tibia, being attached also to the Patella.

ARSW.

- The Popliteal Ligament arises from the external Condyle of the Femur, and, passing in the posterior part of the Capsule, is expanded upon the internal side of the Joint.
- 7 The External lateral arises from the External Condyle, and is inserted into the Head of the Fibula. It generally divided itself into two portions.
- * The Internal lateral arises from the Internal Condyle, and is inserted into the inside of the head of the Tibia.
- The Posterior Crucial arises from the inside of the notch between the Condyles of the Femur, and is inserted into the posterior part of the rough ridge on the top of the Tibia.
- 10 The Anterior Crucial arises from the outside of the notch between the Condyles of the Femur, and is inserted into the middle of the ridge on the top of the Tibia.
- 11 The LIGAMENTS of the Patella are of two kinds, the Anterior Ligament, and the Alar Ligaments.
- 12 The Anterior Ligament arises from the inferior point of the Patella, and is inserted into the Anterior Tuberosity of the Tibia.
- 13 The Alar Ligaments proceed on each side, from the inner side of the Capsular, and are inserted into the sides of the Patella.
- 14 There are THREE LIGAMENTS connecting the Tibia to the Fibula, viz. the Capsular, the Interosseous, and the Transverse.

- 15 The Capsular connects the Upper Extremities of the Tibia and Fibula.
- 16 The Interesseous connects the outer edge of the Tibia to a ridge on the inner side of the Fibula.
- 17 The Transverse Ligaments, anteriorly and posteriorly, connect the lower end of the Fibula to that of the Tibia.
- the Tarsus are five in number, viz. the Capsular, the Deltoid and the Anterior, Middle and Posterior Ligaments of the Fibula.
- The Capsular Ligament surrounds the junction of these Bones with the Astragalus.
- 20 The Deltoid Ligament arises from the internal Malleolus, and is inserted into the Astragalus and Naviculare.
- 21 The Anterior Ligament arises from the External Malleolus, and is inserted into the outside of the Astragalus.
- 22 The Middle Ligament arises from the Tip of the External Malleolus, and is inserted into the outside of the Os Calcis.
- 23 The Posterior Ligament arises from the back part of the External Malleolus, and is inserted into the back part of the Astragalus.
- 24 The LIGAMENTS OF TRE TARSUS are of three kinds, namely, the Capsular, the Transverse, the Plantar, and a Ligament at the internal side of the Foot.
- 25 The Capsular Ligament includes all the Tarsal and the heads of the Metatarsal bones.

- 26 The Transverse Ligaments, passing from one to another, tie the individual bones together.
- 27 The Plantar Ligament is situated on the outside of the sole of the Foot.
- 28 The Internal Ligament passes from the lower part of the Os Calcis to the lower part of the Os Naviculare, supporting the Astragalus.
- 29 The Ligaments of the bases of the Metatarsal bones are of four kinds, viz. the Capsular, the Lateral, the Dorsal, and the Plantar.
- 30 The Capsular Ligaments are derived from that of the Tarsus which includes the bases of these bones.
- 31 The Lateral are situated on each side the Articula-
- 32 The Dorsal are Transverse Ligaments connecting these bones on the back of the Foot.
- 33 The Plantar connect the Metatarsal bones in the sole of the Foot.
- of three kinds, viz. the Capsular, the Lateral, and the Transverse.
- 35 Those of the Phalanges of the Toes are at each joint Capsular and Lateral.
- 26 The Tendons, passing over the Instep and behind the Ancles, are confined in their situations by Ligamentous bands.

Sect. XIV. MUSCLES OF THE TRUNK.

MYOLOGY.

- 1 Muscles are fleshy bodies composed of bundles of parallel contractile fibres, with tendinous Extremities.
- 2 The middle portion of them is generally their principal part. It is of a red colour, softer and thicker than the other parts, and is alone capable of contraction.
- 3 If the fibres run longitudinally the Muscle is termed simple; if they diverge from a tendinous centre they are named rudiated, and when they have a feathery arrangement upon their tendons, they are called penniform, several of these united, complex penniform, &c.
- 4 They generally derive their names either from their use as Levators and Depressors; from their form as Trapezius, Rhomboideus, &c.; from their situation as Occipito-Frontalis, Pectoralis, &c.; or from their points of attachment as Sterno-Costalis Sterno-Cleido Mastoideus, &c.
- 5 The Tendons are generally placed at the extremities of Muscles, and are of a silvery hue, firm, compact, and incapable of contraction.
- 6 The least moveable point of attachment is called the Origin.
- 7 The most moveable point of attachment the Insertion of a Muscle.

SECTION XV.

OF THE MUSCLES OF THE TRUNK.

- it, and the Linea Alba, viz. The Obliquus Externus Abdominis Descendens; the Obliquus Internus Abdominis Ascendens; the Transversalis Abdominis; the Rectus Abdominis; and the Pyramidalis.
- 2 THE OBLIQUUS EXTERNUS arises from the inferior edges of the eight lower ribs, near their sternal ends, by an equal number of serrated digitations, which intermix with the digitations of the Serratus Anticus. Posteriorly, it is covered where it passes from the last Rib to the Crista Ilii by the Latissimus Dorsi, to which it adheres, and superiorly it is connected to the Pectoralis Major and Intercostales: running downward and forward, it is inserted by a thin and broad Tenden into a white line composed of the Tendons of the Abdominal Muscles, called Linea Alba, extending from the last bone of the Sternum to the Pubis. fore this Tendon reaches the Rectus Abdominis, it unites with the Tendons of the Obliquus Internus, and Transversalis, and forms another white line called Linea Semilunaris. This Muscle is also inserted into the middle of the Crista Ilii, and into Poupart's Ligament, extending from its anterior Spine to the angle of the Pubis, and transmits over this Ligament a Fascia to the thigh. The lower part of its

Answ.

Tendon, near the Pubis, divides to form the Abdominal Ring for the Spermatic Cord in Males.—Its use is to bend the Body, or to raise the Pelvis, and by compressing the Abdomen to assist in respiration, in evacuating the fæces, urine, fætus, &c.

- ment, about the middle of which it sends off the Cremaster; from all the Crista Ilii; and by a common Tendon, with the Serratus Posticus Inferior, from the Spines of the three lower Lumbar Vertebræ, and from the Os Sacrum.—It is inserted into the last bone of the Sternum, into the Cartilage of the last true, and those of all the false Ribs, into all the Linea Alba, and into the anterior part of the Pubis. It divides into two layers, the anterior passing before, the posterior, except at its lower part, behind the Rectus Abdominis to the Linea Alba.—Its use is to assist the former, and to bend the body in an opposite direction.
 - the Cartilages of the seven lower Ribs, being there connected with the Intercostals and Diaphragm, also from the Transverse Process of the lastVertebra of the back, from those of the four upper Vertebræ of the Loins, from the inner edge of the Crista Ilii, and from part of Poupart's Ligament.—It is inserted into the inferior bone of the Sternum, and almost all the length of the Linea Alba.—Its use is to compress the Abdomen.

- 5 The Rectus Abdominis arises from each side of the Symphysis Pubis. As it passes up it has four tendinous intersections, and is sheathed by the Tendons of the oblique and transverse Muscles.—Joining fibres of the Pectoral, it is inserted into the Cartilages of the fifth, sixth, and seventh Ribs.—Its use is to depress the Trunk, or to elevate the Pelvis, and to compress the Abdomen.
- 6 The Pyramidalis arises between the origin of the Recti, from the Symphysis Pubis.—It is inserted about one-fourth up the Linea Alba, into it and the inner edge of the Recti.——Its use is to assist the Recti.——
- THE PARTITION between the Thorax and Abdominis called the DIAPHRAGM; its middle is tendinous, the remainder muscular; this part is divided into:
 - 7 The greater Muscle of the Diaphragm, and the lesser
 Muscle of the Diaphragm.
 - The GREATER MUSCLE OF THE DIAPHRAGM arises from the Cartilages of all the false, and of the last true Rib, also from the last bone of the Sternum; it forms a Septum between the Thorax and Abdomen, which is concave inferiorly.—It is inserted in a central tendon, toward the right side of which is a triangular Foramen for the Vena Cava inferior; to its upper part the Pericardium and Mediastinum are attached.—Its use is to act in respiration, and to expel the fæces and urine, and the fætus in parturition.
 - 9 The LESSER MUSCLE OF THE DIAPHRAGM arises by eight slips, from the second, third, and fourth Lumbar

Answ.

Vertebræ, which unite to form its Crura, and between these pass the Aorta and Thoracic Duct; on their outside the great Sympathetic Nerve, and some branches of the Vena Azygos, and about the middle of the fleshy belly of this Muscle the Esophagus and eighth pair of Nerves pass through a considerable Foramen, called the left one, to distinguish it from that situated toward the right of its tendinous centre. It is inserted into the middle tendon posteriorly—its use is to assist the former.

- 10 One Muscle arises from the Pelvis and Vertebræ, and is inserted into the Ribs and Vertebræ, viz. The Longissimus Dorsi;
- 11 It arises from the Spinous and Transverse Processes of the three upper false Vertebræ, from the Spinous and Transverse Processes of the Lumbar Vertebræ, and from the posterior Spine of the Os Ilium.—It is inserted into the Transverse Processes of the Dorsal Vertebræ, and into the lower edge of the ten upper Ribs.—Its use is to extend the Trunk.
- 12 One Muscle arises from the Pelvis and Vertebræ, and is inserted into the Ribs, viz. The Sacro-Lumbalis;
- It is inserted into the Curvature of the Ribs.—Its use is to pull down the Ribs, and to elevate the Trunk.
- 14 One Muscle arises from the Pelvis and Vertebræ, and is
- * This Muscle has properly other origins, because from the upper part of several of the lower Ribs arise as many small Muscles, which being inserted into it are called Musculi Accessorii.

Answ.

inserted into the Vertebræ, viz. The Multifidus

- 15 It arises from the posterior Spine of the Ilium, from the Spinous and Transverse Processes of the upper False Vertebræ, from the Transverse and Oblique Processes of the Lumbar Vertebræ, from the Transverse Processes of the Dorsal, and from those of the four inferior Cervical Vertebræ.—It is inserted into the Spinous Processes of all the true Vertebræ except the first.—

 Its use is to extend the Vertebræ.
- Nibs, viz. The QUADRATUS LUMBORUM;
- 17 It arises from the posterior part of the Crista Ilii.——It is inserted into the last Rib, the side of the last Dorsal Vertebra, and the Transverse Processes of all the Lumbar.——Its use is to bend the Trunk to one side, and when both act, to bend the Trunk forward.
- into the Ribs, viz. The Scalenus Anticus, the Scalenus Medius, the Scalenus Posticus, the Cervicalis Descendens, the Serratus Superior Posticus, and Serratus Inferior Posticus.
- Processes of the fourth, fifth, and sixth Cervical Vertebræ.—It is inserted into the upper side of the first Rib near its Cartilage.—Its use is to bend the Neck, or to elevate the Ribs on one side.
- 20 THE SCALENUS MEDIUS arises from the Transverse Processes of the Cervical Vertebræ.——It is inserted into

Answ.

the outer edge of the first Rib till within an inch of its Cartilage.—Its use is to assist the Scalenus Anticus.

- Processes of the fifth and sixth Cervical Vertebræ.—
 It is inserted into the posterior part of the upper edge of the second Rib.—Its use is to assist the Scalenus Anticus.
- verse Processes of the five Inferior Cervical Vertebræ.

 —It is inserted into the six superior Ribs.—Its use is to turn the Neck obliquely backward, and to one side.
- Spinous Processes of the three last Cervical, and two uppermost Dorsal Vertebræ.—It is inserted into the second, third, fourth, and fifth Ribs.—Its use is to elevate the Ribs.
- with the Latissimus Dorsi from the Spinous Processes of the two inferior Dorsal, and three superior Lumbar Vertebræ.—It is inserted into the under edges of the four lower Ribs, near their Cartilages.—

 Its use is to depress these Ribs.
- Vertebræ, the Longus Colli, the Splenius Cervicis, the Obliquus Capitis Inferior, the Transversalis Colli, the Semi-Spinalis Colli, the Spinalis Dorsi, the Semi-Spinales Dorsi, the Interspinales Colli, the Interspinales Colli, the Interspinales Dorsi et Lumborum, the Intertransver-

Answ

sales Colli et Lumborum, and the Intertransversales Dorsi.

- of the three superior Dorsal Vertebræ, and from the roots of the Transverse Processes of the third, fourth, fifth, and sixth Cervical.—It is inserted anteriorly, into the bodies of all the Cervical Vertebræ.—Its use is to bend the Neck forward, and somewhat laterally.
- THE SPLENIUS CERVICIS arises from the Spinous Processes of the third and fourth Dorsal Vertebræ.—

 It is inserted into the Transverse Processes of the five superior Cervical Vertebræ.—Its use is to extend the Neck.
- 28 THE OBLIQUUS CAPITIS INFERIOR arises from the Spinous Process of the second Dorsal Vertebræ.—It is inserted into the Transverse Process of the first.—Its use is to rotate the head.
- Processes of the five upper Dorsal Vertebræ, being situated between the Trachelo-Mastoideus, and the Splenius Cervicis and Cervicalis Descendens.—It is inserted into the Transverse Processes of the five middle Cervicle Vertebræ.—Its use is to turn the Neck backward and somewhat laterally.
- Processes of the six upper Dorsal Vertebræ.——It is inserted into the Spinous Processes of the five middle Cervical Vertebræ.——Its use is to extend the Neck obliquely backward.

Anws. .

- 31 The Spinalis Dorsi arises from the Spinous Processes of the two upper Lumbar, and three lower Dorsal Vertebræ.—It is inserted into the Spinous Processes of the second, third, fourth, fifth, sixth, seventh, eighth and ninth Dorsal Vertebræ.—Its use is to extend the Spine.
- Processes of the seventh, eighth, ninth, and tenth Dorsal Vertebræ.—It is inserted into the Spinous Processes of the two inferior Cervical, and the seven upper Dorsal Vertebræ.—Its use is to extend the Spine obliquely.
- 33 THE INTERSPINALES COLLI arise from the Spinous Process of one Cervical Vertebra, and are inserted into the Spinous Process of that next it.—Their use is to extend the Neck.
- 34 The Interspinales Dorsi et Lumborum seem father Ligamentous than Muscular.
- from the Transverse Process of one Cervical or Lumbar Vertebra, inserted into the Transverse Process of that next it.—Their use is to approximate these Processes.
- 26 THE INTERTRANSVERSALES DORSI also seem Ligamentous.
- 37 Between the Ribs are the Intercostales Externi, and Intercostales Interni.
- 38 THE INTERCOSTALES EXTERNI arise from the inferior Vol. II.

Anws.

edge of one Rib, between the Spine and its Cartilage.—It is inserted into the upper edge of another, their fibres running from behind forward.—Their use is to elevate the Ribs in inspiration.

- 39 The Intercostales Interni arise from the inferior edge of one Rib, between the Sternum and its Angle, and are inserted like that of the external. They run from before backward.—Their use is to elevate the Ribs in inspiration.
- the Ribs, viz. The Sternum, and is inserted into the Ribs, viz. The Sterno-Costalis, or Triangularis Sterni.
- of the inferior half of the middle bone of the Sternum.—It is *inserted* into the inferior edge of the Cartilages of the third, fourth, and fifth Ribs.—Its use is to depress the Cartilages and contract the Thorax.
- 42 One Muscle arises from the Vertebræ, and is inserted into the Pelvis, viz. The Psoas Parvus,
- 43 It arises laterally from the bodies of the two upper Lumbar Vertebræ.—It is inserted into the brim of the Pelvis, opposite the Acetabulum internally.—Its use is to aid in bending the loins.
- 44 Two Muscles arise from one part of the Pelvis, and are inserted into another, viz. The Coccygeus and Curvater Coccygis.
- 45 THE COCCYGEUS arises from the Spine of the Ischium, and the inside of the lesser Sacro-Ischiatic Ligament.—

Sect. XVI. MUSCLES OF THE MALE ORGANS, &c.

Answ.

It is inserted into the edge of the Os Coccygis.—Its use is to pull that bone forward.

46 The Curvator Coccygis arises internally from the last bone of the Os Sacrum, and the first of the Os Coccygis.—It is inserted, after having joined its fellow, into the second, third, but principally into the fourth bone of the Os Coccygis.—Its use is to curve the Os Coccygis.

SECTION XVI.

OF THE MUSCLES OF THE MALE ORGANS OF GENERATION AND ANUS.

- 1 One Muscle arises from the Obliquus Internus Abdominis, and is inserted into the Testicle, viz. The CRE-MASTER,
- Ring, through which it passes, and descends upon the Spermatic Cord.—It is inserted into the Tunica Vaginalis of the Testis.—Its use is to elevate the Testis.
- 3 That which was called *Dartos*, and supposed to be a Muscle of the Scrotum, appears to be merely condensed cellular Membrane.
- 4 Three Muscles arise from the Tuber Ischii, and are inserted about the Penis, viz. The Erector Penis, the Tranversus Perinei, and Transversus Perinei Alter

Sect. XVI. MUSCLES OF THE MALE ORGANS, &c.

Answ.

arise from the Tuber Ischii, and are inserted about the Penis.

- 5 THE ERECTOR PENIS arises from the Tuber Ischii, and, in its ascent, surrounds the whole Crus Penis.—It is inserted near the union of the Crura Penis.—Its use is to direct, if not to erect the Penis.
- Ischii, passing transversely inward and forward—It is inserted into the Accelerator Urinæ, and the Sphincter Ani, where the above-mentioned Muscle covers the bulb.—Its use is to dilate the bulb, while it draws up the verge of the Anus.
- 7 THE TRANSVERSUS PERINEI ALTER arises behind the Transversus Perinei, but runs more forward.—It is inserted into the Accelerater, where it covers the Bulb anteriorly.—Its use is to assist the Transversus Perinei.
- 8 One Muscle arises from one part of the Penis, and is inserted into another, viz. The Accelerator URINE, or EJACULATOR SEMINIS,
- 9 It arises from the Sphincter Ani, the membranous part of the Urethra, and Crus Penis.—It is inserted into the middle of the bulb, and completely encloses it.—Its use is to compress the bulb.
- 10 One Muscle arises from the Pubis, and is inserted about the prostrate Gland, viz. The Compressor Prostate,
- 11 It arises above the Levator Ani from the internal part of the Os Pubis, between the lower part of the Sym-

Sect. XVI. MUSCLES OF THE MALE ORGANS, &c.

Answ.

physis, and the upper part of the Foramen Ovale.— It is inserted between the Prostate and Rectum, having surrounded the former.—Its use is to compress the inferior part of the Prostate.

- 12 Three Muscles arise from the Pelvis, and are inserted about the Anus, viz. The Levator Ani, the Sphincter Ani Externus, and the Sphincter Ani Internus.
- THE LEVATOR ANI arises from the Spine of the Ischium, from the Membrane covering the Coccygeus
 and Obturator Internus, from the junction of the
 Pubis and Ischium, and from the Pubis above the
 Foramen Thyroideum.—It is inserted, after surrounding the neck of the Bladder, Prostate, Vesiculæ
 Seminales, and the termination of the Rectum, into
 the Sphincter Ani, Acceleratores Urinæ, and tip of
 the Os Coccygis.—Its use is to elevate the Anus.
- THE SPHINCTER ANI EXTERNUS arises from the tip of the Os Coccygis, and surrounds the Anus.—It is inserted into the Perineum, Transversi Perinei, and Acceleratores Urinæ.—Its us is to shut the Anus, and to pull down the bulb of the Urethra.
- 15 The Sphincter Ani Internus may be considered as that part of the fibres of the Rectum which surrounds its extremity.

Sect. XVII. MULCEES OF THE FEMALE ORGANS, &c.

SECTION XVII.

OF THE MUSCLES OF THE FEMALE ORGANS OF GENERATION AND ANUS.

- 1 One Muscle arises from the Ischium, and is inserted into the Clitoris, viz. The ERECTOR CLITORIDIS,
- 2 It arises from the inner side of the Branch of the Ischium, and embraces the Crus of the Clitoris, as far up as the Os Pubis.—It is inserted into the upper part of the Crus and body of the Clitoris.—Its use is to draw the Clitoris downward and backward.
- 3 One Muscle arises from the Clitoris, and is inserted into the Vagina, viz. The Sphincter Vaginæ;
- 4 It arises from the union of the Crura Clitoridis.—It is inserted into the Sphincter Ani and sides of the Vagina, which it surrounds.—Its use is to contract the mouth of the Vagina.
- 5 One Muscle arises from the Tuber Ischii, and is inserted into the Perineum, viz. The Transversus Perinei;
- 6 It arises from the Cellular Membrane, and covers the Tuberosity of the Ischium.—It is inserted into the Perineum, between the Pudendum and Anus, and into the Sphincter Ani.—Its use is to sustain the Perineum.
- 7 One Muscle arises from the Tuber Ischii, and is inserted into the Vagina, viz. The TRANSVERSUS PERINER ALTER;
- s Its origin resembles that of the Transversus Perinei .-- It

Answ.

is inserted into the side of the Vagina.--Its use is to assist the Transversus Perinei.

- 9 One Muscle arises from one Crus Penis and is inserted into the other, viz. The Depressor Urethræ;
- Urethra.---It is inserted into the other Crus of the Penis.---Its use is to depress the Urethra.
- 11 Three Muscles arise from the Pubis, and are inserted about the Anus, viz. The Levator Ani, the Sphincter Ani Externus, and Sphincter Ani Internus.
- The LEVATOR ANI arises, as in the Male, and descends along the inferior part of the Vagina and Rectum.——
 It is inserted into the Perineum, Sphincter Ani, and extremities of the Rectum and Vagina.——Its use is to elevate the Rectum and Vagina.
- 13 The Sphincter Ani Fxternus arises as in the Male, from the tip of the Os Coceygis, and surrounds the Anus.—It is inserted into the Perineum.—Its use is to shut the Rectum, and by pulling down the Perineum, to contract the Vagina.
- 14 The Sphincter Ani Internus exactly resembles that of the Male.

SECTION XVIII.

OF THE MUSCLES OF THE HEAD, FACE, &c.

- 1 The PLATYSMA MYOIDES;
- 2 It arises from the Cellular Substance covering the Deltoid

Answ.

and Pectoral Muscles superiorly, and passes upward in a very thin layer almost immediately under the Cutis of the Neck.---It is inserted into the skin covering the lower jaw, between its angle and the chin, also into that covering the Masseter and Parotid Gland.---Its use is to approximate the portions of Integument into which it is inserted.

- 3 Ten Muscles of the Head arise from the Sternum, Ribs, or Vertebræ, viz. the Sterno-Cleido-Mastoideus, the Rectus Capitis Anticus Major, the Rectus Capitis Anticus Minor, the Rectus Capitis Lateralis, the Splenius Capitis, the Complexus, the Trachelo-Mastoideus, the Rectus Capitis Posticus Major, the Obliquus Capitis Superior, and the Rectus Capitis Posticus Minor.
- of the Sterno-Cleido-Mastoideus arises from the top of the Sternum laterally, and from the upper and anterior part of the Olavicle.—It is inserted into the Mastoid Process, and as far back as the Lambdoidal Suture.—Its use is to turn the Head on one side, and bend it forward.
- 5 The Rectus Capitis Androus Major arises from the anterior parts of the Transverse Processes of the third, fourth, fifth, and sixth Cervical Vertebræ, by distinct commencements.—It is inserted into the Basilary Process of the occipital bone, just before the Condyles.—Its use is to bend the Head forward.
- 6 The RECTUS CAPITIS ANTICUS MINOR arises anteriorly

Anws.

from the first Vertebra of the Neck, opposite its superior oblique Processes.—It is inserted near the root of the Condyles of the Os Occipitis, further outward than the former Muscle.—Its use is to Nod the Head.

- 7 The RECTUS CAPITIS LATERALIS arises anteriorly, from the point of the Transverse Process of the first Vertebræ of the Neck.---It is inserted into the ridge of the Os Occipitis external to the Condyles.--- Its use is to bend the Head to one or the other side.
- vical Spines, and the Ligamentum Nuchæ. They recede from each other at the third Vertebra of the Neck, and show between them the Complexus.—It is inserted into the hollow of the Os Occipitis, below its transverse ridge, and externally to the Complexus, also into the Mastoid Process posteriorly.—Its use is to pull the Head backward and to one side.
- The Complexus arises from the Transverse Processes of the four inferior Cervical, and seven superior Dorsal Vertebræ, also from the Spinous Process of the first Dorsal.—It is inserted into the hollow of the Os Occipitis below its Transverse Ridge.—Its use is to pull the Head laterally backward.
- The TRACHELO-MASTOIDEUS arises from the Transverse Processes of the five inferior Cervical, and three superior Dorsal Vertebræ..--It is inserted into the middle of the posterior part of the Mastoid Pro-

Anws.

cess.---Its use is to pull the Head backward, but more laterally than the Complexus.

- 11 The Rectus Capitis Posticus Major arises from the external part of the Spine of the second Cervical Vertebra.—It is inserted into the Os Occipitis about an inch behind the Foramen Magnum.—Its use is to pull the Head backward, and a little laterally.
- The Obliques Capitis Superior arises from the Transverse Process of the first Cervical Vertebra.—It is inserted into the Os Occipitis externally, to the Rectus Capitis Posticus Major, and below the Complexus.—Its use is to pull the Head backward.
- 13 The Rectus Capitis Posticus Minor arises from the middle of the posterior arch of the Atlas.——It is inserted into a depression immediately behind the Foramen Magnum.——Its use is to pull the Head backward.
- 14 The Occipito-Frontalis, and the Corrugator Supercilii, arise from the Skull, and are inserted into the Integuments.
- Transverse Ridge of the Os Occipitis, becoming tendinous as it passes upward over the Cranium; it is connected to the Temporalis, the Attolens Aurem, and the Zygoma, and advancing to the brow it becomes again Muscular.— It is inserted into the Orbicularis, and the Skin of the Eyebrows.——Its use is to raise the Eyebrows, and to pull backward, or to wrinckle the Skin of the Head.

Answ

- Angular process of the Os Frontis, thence running outward and upward—It is inserted internally into the inferior part of the Occipito-Frontalis. Its use is to draw the Eyebrows together, and to wrinkle the skin of the Forehead Longitudinally.
- 17 The Levator Palpebræ Superioris, and Orbicularis Palpebrarum, arise from the Cranium, and are inserted into the Eyelids.
- 18 The LEVATOR PALPEBRE SUPERIORIS arises from the upper part of the Foramen Opticum of the Os Sphænoides, above the Levator Occuli. It is inserted into the upper Eyelid. Its use is to pull the Eyelid upward.
- The Orbicularis Palpebrarum arises at the inner angle of the Eye from the outside of the Nasal Process of the Superior Maxillary Bone, and, surrounding the Eye externally—It is inserted, after having passed over the Lachrymal Sac, where it arose. Its use is to shut the Eye, press the Eyeball, squeeze the Lachrymal Gland, and convey the tears toward the Puncta Lachrymalia.
- 20 Six Muscles arise from the Cranium, and are inserted into the Eyeball, viz. the Levator Oculi, Adductor Oculi, Abductor Oculi, Trochlearis or Obliquus Superior, and Obliquus Inferior Oculi.
- 21 The Levator Oculi arises from the upper part of the Foramen Opticum of the Sphænoid Bone, beneath the Levator Palpebræ Superioris. It is inserted into the

Answ.

Superior and Anterior part of the Sclerotic Coat. Its use is to elevate the Ball of the Eye.

- 22 The Depressor Oculi arises from the Inferior part of the Foramen Opticum. It is inserted opposite to the Levator Oculi. Its use is to Depress the Ball of the Eye.
- men Opticum, between the Obliquus Superior and the Depressor. It is inserted opposite to the inner Angle. Its use is to Adduct or turn the Eye toward the Nose.
- 24 The Abductor Oculi arises from the outward edge of the Foramen Opticum It is inserted opposite to the outer angle. Its use is to turn the Eye toward the Temple.
- the edge of the Foramen Opticum, between the Levator and Adductor Oculi, thence, turning to the Cartilaginous Trochlea on the inside of the Internal Angular Process of the Os Frontis, it passes through it and turns its course downward, outward, and backward. It is inserted into the Sclerotic Coat, half way between the insertion of the Levator and the Optic Nerve. Its use is to roll the ball of the Eye from above inwardly, to pull it forward, inward, and upward, and to turn the Pupil downward and outward.
- 26 The Obliquus Inferior Oculi arises from the outer edge of the Orbitar Process of the Superior Maxillary

Answ.

Bone, near the Depression for the Lachrymal Duct; running outward and backward, it is inserted into the Sclerotic Coat between the Abductor and the Optic Nerve. Its use is to roll the ball of the Eye from above outwardly, to pull it forward, inward, and downward, and to turn the Pupil upward and inward.

- 27 Three Muscles arise from the Cranium and are inserted into the External Ear: viz. the Attolens Aurem, Anterior Auris, and Retrahens Auris.
- Occipito-Frontalis, where it covers the Temporal Aponeurosis. It is inserted superiorly, into the back of the Concha. Its use is to Elevate the Ear.
- 29 'The Anterior Auris arises from the posterior part of the Zygoma. It is inserted Anteriorly into the back of the Helix. Its use is to pull the Ear forward.
- or The Retrahens Auris arises often by three origins from the external part of the root of the Mastoid process. It is inserted posteriorly into the back edge of the Concha. Its use is to pull the Ear backward.
- 31 Five Muscles, viz. the Helicis Major, Helicis Minor, Tragicus, Anti-Tragicus, and Transversus Auris are wholly attached to the External Ear.
- 32 The Helicis Major arises from the acute process of the Helix. It is inserted into the Helix a little higher up. Its use is to contract that part of the Helix.

- 33 The Helicis Minor arises from the Inferior and Anterior part of the Helix nearer its edge than the former. It is inserted into the Helix a little higher up. Its use is to bring together the edges of a Fissure over which it passes.
- 34 The Tragicus arises anteriorly from the middle of the Anterior edge of the Concha. It is inserted into the Tip of the Tragus. Its use is to pull the point of the Tragus forward.
- 35 The Anti-Tragicus arises from the termination of the Anti-Helix. It is inserted into the tip of the Anti-Tragus. Its use is to approximate these points by shutting the Fissure between them.
- 36 The Transversus Auris arises from the superior and posterior edge of the back of the Concha. It is inserted superiorly into the back of the Fossa Navicularis, and posteriorly into the back of the Fossa Innominata. Its use is to approximate these Cavities.
- 37 Four Muscles, viz. the Laxator Tympani Mojor, Laxator Tympani Minor, Tensor Tympani, and Stapedius, are the Muscles of the Ossicula Auditus.
- on The Laxator Tympani Major arises from the Styliform Process of the Sphoenoid bone, running backward it passes through the Fissura Glasseri. It is inserted into the Long process of the Malleus where it rests upon the same Fissure. Its use is to pull the Malleus and Membrana Tympani obliquely forward.

- 29 The Laxator Tympani Minor arises from the Superior Posterior margin of the Meatus Auditorius, where the Membrana Tympani adheres to it, and descends inward and forward. It is inserted into the neck of the Malleus near its short process. Its use is to pull the Malleus and Membranæ Tympani forward and upward.
- of the Eustachian Trumpet and Styliform Process of the Sphoenoid Bone, thence running back above the Osseous part of the Eustachian Tube within a thin Osseous Plate, it makes a turn forward into the Tympanum. It is inserted posteriorly into the handle of the Malleus below its long process. Its use is to pull the Malleus and membrana Tympani inward.
- 41 The Stapedius arises from a hollow Pyramid on the posterior side of the Tympanum, before the lower end of the Fallopian Aqueduct. It is inserted into the posterior part of the Head of the Stapes. Its use to pull the Stapes upward and backward.
- 42 The Compressor Naris is the only Muscle which
- 43 Arises from the superior part of the Cartilage of the Nose.

 It is inserted into its Inferior part. Its use is to compress the Alæ.
- 14 Two Muscles, viz. the Levator Labii Superioris Alæque Nasi, and Depressor Labii Superioris Alæque Nasi, arise from the Cranium, and are inserted into the Nose and Lips.

- by two commencements, one from the external edge of the Orbital Process of the Superior Maxillary Bone, the other from the upper part of its Nasal Process. It is inserted first into the upper Lip and Orbicularis Labiorum, and second into the upper Lip and outer part of the Ala Nasi. Its use is to elevate the upper Lip and Ala Nasi.
- from the depression of the Os Maxillare Superius. above the Dentes Incisivi and Caninus, thence running up under the Levator;—it is inserted into the upper Lip and root of the Ala Nasi. Its use is todraw the upper Lip and Ala Nasi downward and backward.
- 47 The NASALIS LABII SUPERIORIS is the only Muscle which
- 48 Arises from the Tip and Septum of the Nose; enlarging and descending obliquely outward;—it is inserted into the Orbicularis Oris. Its use is to bring closer the Angles of the Mouth, or to depress the Tip of the Nose.
- 49 Six Muscles, viz. the Depressor Labii Inferioris, Levator Labii Inferioris, Depressor Anguli Oris, Buccinator, Zygomaticus Major, and Zygomaticus Minor, all are attached to the Cranium and inserted into the Lips.
- 50 The Depressor Labii Inferioris arises anteriorly, from the inferior part of the lower Jaw. It is inserted

Answ.

into the edge of the under Lip.—Its use is to depress the under Lip.

- 51 The LEVATOR LABII INFERIORIS arises from the depression of the Os Maxillare Inferius, below the Dentes Incisivi and Caninus.—It is inserted into the under Lip and skin of the Chin.—Its use is to pull these parts upward.
- The Depressor Anguli Auris arises from the inferior edge of the Maxilla Inferior, by the side of the Chin; it is connected externally to the Integuments and to the Platysma Myoides, and internally to the Depressor Labii Inferioris, becoming gradually narrower,—It is inserted into the angle of the Mouth.

 Its use is to pull down the angle of the Mouth.
- The Buccinator arises from the upper Jaw, behind its Dens Sapientiæ, where it is connected with the Constrictor Pharyngis Superior, and from the lower Jaw, as far back as its Dens Sapientiæ and the root of its Coronoid Process.—It is inserted into the angle of the Mouth, within the Orbicularis Oris.—Its use is to pull the angle of the Mouth backward, and to press the Chin inward.
- 54 The Zygomaticus Major arises from the Zygomatic process of the Os Malæ.—It is inserted into the angle of the Mouth.—Its use is to draw upward and outward the corner of the Mouth.
- 55 The Zygomaticus Minor arises from above the origin of the Zygomaticus Major.—It is inserted into the Vol. II.

Answ.

upper Lip, near the corner of the Mouth.—Is use is to draw upward and outward the corner of the Mouth.

- 55 The Orbicularis Oris,
- 57 Arises from the other Muscles of the Lips, the superior fibres descending, the inferior ascending, and decussating each other about the angle of the Mouth.—It is inserted into fibres from the opposite side.—Its use is to shut the Mouth and compress the Lips.
- 58 The Anomalus Maxille Superioris,
- of the upper Jaw.—It is inserted below the origin of the first portion of the Levator Labii Superioris Alæque Nasi.—Its use is to act only on the vessels and nerves from the attachment of both its ends to one bone.
- deus Externus, Pterygoideus Internus, and Digastricus, arise from the Cranium, and are inserted into the lower Jaw.
- GI The Temporalis arises from the Temporal ridge, and depression of the Os Frontis and Os Parietale, from the Temporal process of the Sphænoid Bone, and from the Aponeurosis which covers it.—It is inserted around the Coronoid process of the lower Jaw.—Its use is to pull the lower Jaw upward and backward.
- 62 The Masseter arises from the superior Maxillary Bone, where it joins the Os Malæ, and from the inferior

Anws.

and interior part of the Zygoma thoughout its length, the external Fibres starting backward, the internal forward.—It is *inserted* into the outside of the Angle and Ramus of the lower Jaw.—Its use is to elevate the lower Jaw, and to pull it a little forward or backward.

- of the external Pterygoid process of the Sphoenoid Bone, from part of the Tuberosity of the Os Maxillare, and from the root of the Temporal process of the Os Sphoenoides.—It is inserted into a Cavity on the anterior part of the neck of the Condyloid process of the lower Jaw, and into the Capsular Ligament of the Joint.—Its use is to pull the Jaw forward and to the opposite side, and to pull the Ligament from the Joint.
 - Fossa of the Sphænoid and Palate Bones...-It is inserted into the angle of the lower Jaw internally...

 Its use is to pull the Jaw upward, and toward the other side.
- of the Mastoid process of the Temporal Bone, becoming tendinous in its middle it perforates the Stylo-Hyoideus, and is fixed by a Ligament to the Os Hyoides and again ascends.—It is inserted into a rough Sinuosity at the inferior edge of the Chin.——Its use is to depress the lower Jaw and open the

Sect. XIX. OF THE LARYNX AND PHARYNX.

- Answ.

Mouth; but, when the Jaw is fixed, to raise the Larynx and Pharynx in deglutition.

SECTION XIX.

OF THE LARYNX AND PHARYNX.

A General Description of these Parts must precede that of the Muscles of the Organs of Voice and Deglutition.

LARYNX.

- 1 The LARYNX is the Organ of Voice.
- 2 It is situated at the upper and forepart of the Neck, at the root of the Tongue, just below the Os Hyoides.
- 3 It is composed chiefly of Cartilages and Ligaments, which, when united, form a hollow body permanently open.
- 4 Its Cartilages are five, namely, the Thyroid, the Cricoid, the two Arytanoid, and Epiglottis.
- 5 The THYROID CARTILAGE is placed at the anterior part of the Larynx;
- forward, and then slope backward. Its superior edge has a notch in the middle that may be easily felt, and elevations on each side, and terminates in two Cornua posteriorly, which ascend. Its inferior edge is straight and terminates also in two shorter Cornua, which bend downward. Its posterior edges are entirely

Sect. XIX. OF THE LARYNX AND PHARYNX.

Anws.

straight, and on the outer side of each Ala a line runs from a small knob near its upper corner forward and downward, to terminate in another.

- 7 The Cricoid Cartilage is placed at the lower part of the Larynx, its broadest side being backward,
- The outer surface of its posterior side has upon it a longitudinal line, and depressions on each side of it for the attachment of Muscles. The top of the same side slopes downward and outward, terminating in angles, which are smooth for connection with the Arytænoid Cartilages, and from these angles elevated lines descend to terminate in smooth surfaces, for the lower Cornua of the Thyroid Cartilage.
- 3 The ARYTENOID CARTILAGES are placed posteriorly upon the greater side of the Cricoid Cartilage;
- They are somewhat of a pyramidal form, but their posterior side is concave, their anterior convex, their external edge oblique, and their internal one straight. Their bases rest on the Cricoid Cartilage, with which they have a moveable connection.
- 11. The Epigeottis is placed anteriorly above the other Cartilages;
- 12. It is narrower, but somewhat thick at its base, and its superior part is thin, flat, and flexible with convex edges, it is also convex posteriorly, and concave anteriorly.
- A short LIGAMENT connects the body of the Os Hyoides to the notch of the Thyroid Cartilage, from which a Ligament proceeds to the Epiglottis, and another from

Sect. XIX. OF THE LARYNX AND PHARYNX.

Answ.

the Epiglottis to the body of the Os Hyoides, thus leaving behind them a triangular space. Ligaments also connect the Cornua of the Os Hyoides to those of the Thyroid Cartilage, and the lateral Ligaments of the Epiglottis are attached to the tops of the Arytænoid Cartilages. The inferior Cornua of the Thyroid Cartilage are likewise connected to the lower articular surfaces of the Cricoid by short Ligaments, and the inferior edge of the one is also connected to the superior part of the other. The Cricoid Cartilage is connected by Ligaments to the bases of the Arytænoid Cartilages above, and to the first ring of the Trachea below.

- Ligaments which proceed from the middle of the posterior side of the Thyroid Cartilage to the bases of the Arytænoid Cartilages, and immediately beneath these two other Ligaments are placed; the superior and inferior Ligaments on each side leave a narrow fissure between them, which is the opening of a small Sac.
- 15 The LARYNX forms the chief part of the organ of voice, and affords a passage permanently open for respiration; it also gives attachment to numerous muscles.

PHARYNX.

The PHARYNX is a membranous and muscular bag expanded above, contracted below, and terminating in the Gullet, or Œsophagus.

Sect. XX. MUSCLES OF THE ORGANS OF VOICE, &c.

Answ.

- 17 It is placed behind the Mouth, Nares, and Larynx, below the Cuneiform process of the Os Occipitis, before the Cervical Vertebræ, and above the Œsophagus.
- 18 It is composed of circular muscular fibres, and of a membrane copiously supplied with mucous Glands.
- 19 It is divided into three portions, a superior, which is called its Arch; a middle, which is its Body; and an inferior, which is its Sphincter.
- 20 Its upper part is extremely wide, extending almost all the way between the Styloid processes; it then contracts on each side, and behind the upper part of the Larynx, again expanding behind the Larynx and before the Atlas, it forms considerable folds.
- 21 It is chiefly useful in Deglutition, receives the food, and transmits it to the Esophagus.

SECTION XX.

OF THE MUSCLES OF THE ORGANS OF VOICE AND DEGLUTITION.

- 1 Four Muscles, viz. the Digastricus, Stylo-Hyoideus, Mylo Hyoideus, and Genio-Hyoideus, arise from the Cranium, and are inserted into the Larynx.
- 2 The DIGASTRICUS has already been described.
- 3 The STYLO-HYOLDEUS arises from the middle and inferior part of the Styloid process; it is inserted into the lateral and inferior part of the body of the Os Hyoides, below its middle its fibres separate to allow the pas-

Sect. XX. MUSCLES OF THE ORGANS OF VOICE, &c.

Answ.

sage of the Tendon of the Digastricus. Its use is to pull the Os Hyoides upwards and to one side.

- of the lower Jaw, between the last Dens Molaris, and the middle of the Chin, where it joins its fellow.—It is inserted into the middle of the base of the Os Hyoides and its fellow.—Its use is to pull the Os Hyoides forward, upward, and laterally.
- the Genio Glossus arises from a rough protuberance in the middle of the inside of the Chin.—It is inserted into the middle of the upper part of the Os Hyoides.—Its use is to pull the Os Hyoides forward and upward, and assist in depressing the lower Jaw.
- 6 Two Muscles, viz. the Sterno-Hyoideus, and Sterno-Thyroideus, arise from the Trunk and are inserted into the Larynx.
- 7 The Sterno-Hyoldeus arises from the junction of the Sternum and Clavicle, and from the Capillage of the first Rib.—It is inserted into the middle of the lower part of the basis of the Os Hyoides.—Its use is to pull the Os Hyoides downward.
- s The Sterno-Thyroldeus arises from the edge of the upper bone of the Sternum, opposite the Cartilage of the first Rib internally.—It is inserted into the rough line at the external part of the lower edge of the Thyroid Cartilage.—Its use is to pull the Thyroid Cartilage downward.
- 9 The Omo-Hyondeus,
- 10 It arises from about the Semilunar Notch of the superior

Answ.

Costa of the Scapula, ascending upward and forward behind the Sterno-Cleido-Mastoideus, it becomes tendinous and again grows fleshy.—It is inserted into the sides of the lower part of the basis of the Os Hyoides.—Its use is to pull the Os Hyoides obliquely downward.

- 11 Nine Muscles have both origin and insertion on the Larynx, viz. the Thyreo-Hyoideus, Musculus Giandulæ
 Thyroideæ, Crico-Thyroideus, Crico-Arytænoideus Posticus, Crico-Arytænoideus Lateralis, Thyreo-Arytænoideus Major, Thyreo-Arytænoideus Minor, Arytænoideus Obliquus, and Arytænoideus Transversus.
- the External part of the Thyroid Cartilage.—It is inserted into part of the basis and all the Cornu of the Os Hyoides externally.—Its use is to pull the Os Hyoides downward, or the Thyroid Cartilage upward.
- 13 The Muculus Glandulæ Thyroideæ arises from the lower edge of the basis of the Os Hyoides, and crosses the Thyroid Cartilage.—It is inserted into the middle of the Thyroid Gland.—Its use is to pull the Gland toward the Os Hyoides.
- 14 The CRICO-THYROIDEUS arises from the anterior and lateral parts of the Cricoid Cartilage, and runs obliquely upward and outward.—It is inserted by two terminations, one into the base of the Thyroid Cartilage, the other into its inferior Cornu.—Its use is to pull downward and forward the Thyroid, or upward and backward the Cricoid.

Answ.

- posterior part of the Cricoid Cartilage.—It is inserted posteriorly into the base of the Arytænoid.—Its use is to pull back the Arytænoid Cartilages, and to open the Rima Glottidis.
- 16 The CRICO-ARYTENOIDEUS LATERALIS arises from the side of the Cricoid Cartilage, where it is covered by the Thyroid.—It is inserted into the side of the base of the Arytenoid.—Its use is to open the Rima Glottidis.
- 17 The Thyreo-Arytenoideus Major arises from the inferior and posterior part of the body of the Thyroid Cartilage, running upward and backward along the side of the Glottis.—It is inserted into the Arytenoid Cartilage above and before the Crico-Arytenoideus Lateralis.—Its use is to pull forward the Arytenoid toward the middle of the Thyroid, and to relax the Glottis.
- 18 The THYREO-ARYTENOIDEUS MINOR arises from the Thyroid Cartilage, near its Incisura Cordiformis—It is inserted into the Arytenoid Cartilage.—Its use is the same as that of the Thyreo-Arytenoideus Major.
- The ARYTENOIDEUS OBLIQUUS arises from the base of one Arytenoid Cartilage, and crosses its fellow.—It is inserted into the tip of the other Arytenoid Cartilage.—

 Its use is to approximate the Arytenoid Cartilages.
- 20 The ARYTENOIDEUS TRANSVERSUS,
- 21 It arises from the side of one Arytænoid Cartilage.—It is

Answ

- inserted into the side of the other Arytænoid Cartilage.—Its use is to shut the Rima Glottidis.
- 22 Two Muscles, viz. the Genio-Glossus, and Stylo-Glossus, arise from the Cranium, and are inserted into the Tongue.
- The Genio-Glossus arises from a rough point on the inside of the middle of the Chin, and its fibres run forward, upward and backward.—It is inserted into the tip, middle, and root of the Tongue, slightly also into the base of the Os Hyoides laterally.—Its use is to draw the tip of the Tongue back, its middle down, or to make its Dorsum concave; to draw also the Os Hyoides forward, and to thrust the Tongue out of the Mouth.
- 24 The Stylo-Glossus arises from the Styloid process, and the lateral Ligament of the lower Jaw.—It is inserted into the root and sides of the Tongue.—Its use is to pull the Tongue to a side and backward.
- 25 The STYLO-GLOSSUS,
- 26 Arises from the base, cornu and appendix of the Os
 Hyoides.—It is inserted into the side of the Tongue.—
 Its use is to pull the Tongue inward and downward.
- 27 The LINGUALIS,
- 28 Arises from the side of the root of the Tongue, and runs forward between the Hyo and Genio-Glossus.—It is inserted into the tip of the Tongue.—Its use is to contract the Tongue in length.
- 29 Three Muscles arise from the Cranium, and are inserted

Anws.

into the Palate, viz. the Circumflexus, or Tensor Palati, and Levator Palati.

- the Styliform process of the Sphænoid Bone, and from the Osseous part of the Eustachian Tube, it runs down along the Pterygoideus Internus, passes over the hook of the internal Pterygoid process, and spreads into a broad Membrane.—It is inserted into the Velum Pendulum Palati, and the semilunar edge of the Palate bone; its posterior Fibres sometimes join the Constrictor Pharyngis Superior and Palato-Pharyngeus.—Its use is to draw the Velum downward, and to stretch it laterally.
 - Petrous Portion of the Temporal bone, and from the Membranous part of the Eustachian Tube.---It is inserted into the Velum Pendulum Palati as far as the Uvula.---Its use is to draw the Velum upward and backward, and so shut the passage from the Fauces to the Nose.
- 32 Three Muscles viz. the Thyreo-Epiglottideus Major,
 Thyreo-Epiglottideus Minor, and Arytæno-Epiglottideus, arise from the Larynx, and are inserted into the
 Epiglottis.
- Fibres from the Thyroid Cartilage.---It is inserted into the Epiglottis laterally.---Its use is to draw downward and to expand the Epiglottis.
- 34 The ARYTENO-EPIGLOTTIDEUS arises just above the

Answ.

- Thyreo-Epiglottideus Major.--It is inserted into the side of the Epiglottis, above its root.—Its use is to draw downward, and to expand the Epiglottis.
- and upper part of the Arytænoid Cartilage, it runs along the outside of the external Rima.—It is inserted into the Epiglottis along with the Thyreo Epiglottideus Minor.—Its use is to pull the Epiglottis upon the Rima.
- 36 The Azygos UvulE,
- 37 Arises from the extremity of the Suture of the Palate bones, and runs down the Velum and Uvula.—It is inserted into the tip of the Uvula.—Its use is to elevate the Uvula.
- 38 The Constructor Isthmi Faucium,
- at the root of the Uvula, being there connected with its fellow, and with the Palato Pharyngeus.—Its use is to pull the Velum and the root of the Velum and the root of the Velum and the root of the Uvula, being there connected with its fellow, and with the Palato Pharyngeus.—Its use is to pull the Velum and the root of the Tongue toward each other, so contracting the passage between the two arches, and shutting the opening into the Fauces.
- into the Pharynx, viz. the Stylo Pharyngeus, and Constrictor Pharyngis Superior.
- Styloid process.—It is inserted into the side of the Pharynx, and back of the Thyroid Cartilage.—Its use

Answ.

is to dilate and to elevate the Pharynx and Thyroid Cartilage.

- the Cuneiform process of the Os Occupitis, near the Anterior Codyloid Foramina; from the Pterygoid process of the Sphoenoid bone, from the upper and under Jaw, near the Dentes Sapientiæ; being connected at this point with the Buccinator, and with fibres from the Tongue and Palate.—It is inserted into a white line in the middle of the posterior part of the Pharynx, being covered by the Constrictor Medius.—Its use is to compress the upper part of the Pharynx, and to draw it upward and forward.
 - and Constrictor Pharyngis Medius, and Constrictor Pharyngis Inferior, arise from the Larynx, and are inserted into the Pharynx.
 - appendix and cornu of the Os Hyoides, and from the Ligament connecting it to the Thyroid Cartilage.--It is inserted into the white line on the back of the Pharynx, its upper fibres being connected to the Cuneiform process of the Occipital Bone.--Its use is to compress the Pharynx, and to draw it and the Os Hyoides upward.
 - from the Thyroid Cartilage, near the attachment of the Sterno and Thereo-Hyoidei; also from the Cricoid Cartilage, near the Crico-Thyroideus; being the largest of the three Constrictors.—It is inserted into

Answ.

the white line on the back of the Pharynx, its superior fibres covering half the Constrictor Medius, and its inferior the commencement of the Œsophagus.——Its use is to compress the Pharynx, and to raise it and the Larynx upward.

46 The Palato Pharyngeus arises posteriorly from the middle of the Velum Pendulum Palati at the root of the Uvula, and also from the tendinous expansion of the Tensor Paliti. Passing behind the Amygdala, and within the posterior arch, its fibres run back to the sides and upper part of the Pharynx.—It is inserted into the posterior and upper edge of the Thyroid Cartilage, and between the inferior Constrictors and the Pharynx.—Its use is powerfully to contract the Fauces.

SECTION XXI.

MUSCLES OF THE UPPER EXTREMITY.

- 1 Six Muscles, viz. the Pectoralis Minor, Angularis Sea- pulæ, Trapezius, Rhomboideus, Serratus Magnus, and Subclavius, arise from the Trunk and are inserted into the Shoulder.
- The Pectoralis Minor arises tendinous and fleshy from the upper edge of the third, fourth and fifth ribs near their Cartilages.— It is inserted by a short Tendon into the Coracoid Process of the Scapula.——Its use is to pull the Scapula forward and downward.

Suls extremis

Anws.

- The Angularis Scapulæ erises from the Transverse processes of the five superior Vertebræ of the Neck.——
 It is inserted into the superior angle of the Scapula.——
 Its use is to elevate the base of the Scapula.
- 4 The Trapezius arises from the Spine and transverse ridge of the Occiput, the Ligamentum Nuchæ, the Spinous processes of the two Inferior Vertebræ of the Neck, and from all those of the back.—It is inserted into the posterior half of the Clavicle, the Acromion and almost all the Spina Scapulæ.—Its use is to pull the Scapula upward and backward, backward, or backward and downward.
- 5 The Rhomboideus arises from the Spinous processes of the three inferior Vertebræ of the Neck, the Ligamentum Nuchæ and the five superior of the back.

 It is inserted into all the base of the Scapula.—Its use is to draw the Scapula inward and upward.
- 6 The Serratus Magnus arises from the nine superior Ribs, by as many Digitations.——It is inserted into all the inner edge of the base and angles of the Scapula.——Its use is to pull the Scapula forward.
- 7 The Subclavius arises from the Cartilage of the first Rib.---It is inserted into almost all the inferior side of the Clavicle.---Its use is to pull the Clavicle downward.
- 8 Two Muscles, viz. the Pectoralis Major, and Latissimus Dorsi, arise from the Trunk, and are inserted into the Humerus.
- 9 The Pectoralis Major arises from the Cartilages of the

a n Barr

Answ.

fifth and sixth ribs, where its fibres mix with those of the Obliquus Externus Abdominis, from almost all the length of the Sternum, and from more than half the anterior edge of the Clavicie.—It is inserted by two broad tendons which cross each other into the outer ridge of the Bicipital Groove.—Its use is to move the arm upward and inward.

- of the Crista Ilii, from all the Sacral and Lumbar Vertebral Spines, and from the seven inferior Dorsal; and by digitations from the three or four inferior ribs; passing over the inferior angle of the Scapula, it turns before the Teres Major.—It is inserted into the inner edge of the Bicipital Groove.—Its use is to pull the arm backward and downward, and to rotate the Humerus.
- into the Humerus, viz. the Deltoides, Coraço-Brachialis, Supra-Spinatus, Infra-Spinatus, Teres Minor, Teres Major, and Subscapularis.
- The Deltoides arises from that anterior portion of the Clavicle which is unoccupied by the Pectoralis Major, from the Acromion and inferior edge of the Spina Scapulæ.—It is inserted into an extensive roughness on the middle of the outside of the Humerus.—Its use is to pull the arm upward and forward, directly upward, or upward and backward.
- The Coraco-Brachialis arises from the tip of the Processus Coracoides adhering to the short head of the Vol. II.

Answ.

Biceps.—It is inserted into the middle of the internal part of the Humerus.—Its use is to raise the arm and move it forward.

- The Supra Spinatus arises from all the Supra Spinal Fossa of the Scapula, passing under the Acromion, it adheres to the Capsular Ligament of the Shoulder.—
 It is inserted into the superior depression of the Tuberosity on the outside of the Bicipital Groove.—Its use is to raise the Arm and the Capsular Ligament.
- Fossa Scapulæ, and adheres to the Capsular Ligament.
 It is inserted into the middle depression of the same
 Tuberosity.—Its use is to raise the Humerus, and
 to rotate it outward.
- pulæ, and adheres to the Capsular Ligament.—It is inserted into the inferior depression of the same Turosity.—Its use is to draw the Humerus backward, and to rotate it outward.
- The Teres Major arises from the outside of the inferior angle of the Scapula, and adheres to the Capsular Ligament.—It is inserted into the inner edge of the Bicipital Groove.—Its use is to draw the Humerus backward, and to rotate it inward.
- Scapula, and adheres to the Capsular Ligament.---It is inserted into the internal Tuberosity at the head of the Humerus.---Its use is to rotate the Humerus inward, and to bring it to the side of the body.

Answ

- 19 Two Muscles, viz. the Biceps Cubiti, and Long Head of the Triceps, arise from the shoulder, and are inserted into the fore-arm.
- The BICEPS CUBITI arises by two heads; one from the superior Margin of the Glenoid Cavity, it passes through the Capsular Ligament of the Shoulder, over the head of the Humerus, and through the groove between the Tuberosities; the other, or short head, arises conjoined with the Coraco-Brachialis, from the Coracoides Scapulæ; both heads unite at the middle of the Humerus.---It is inserted into the Tuberosity on the inner side of the upper end of the Radius.---Its use is to supinate the hand, to bend the Forearm, and to raise the arm.
- The TRICEPS, as its name implies, has three distinct heads, of which the middle one is the longest. The First, or Long Head of the Triceps, arises from the Inferior Costa Scapulæ, near its Cervix.---It is inserted into the Olecranon of the Ulna.---Its use is to extend the fore-arm, and to carry the arm backward.
- 22 Six Muscles, viz. the Shorter Heads of the Triceps, the Anconeus, Brachialis Internus, Supinator Radii Longus, Supinator Radii Brevis, and Pronator Radii Teres, arise from the Humerus, and inserted into the Forearm.
- 23 The SHORTER HEADS OF THE TRICEPS. The second, or most external, arises from the back of the Humerus, near its upper end; and the third, which is the shortest, from the back of the Humerus lower down,

Answ.

and from the Inter-Muscular Ligament.— They form one Muscle with the Long Head, and their common insertion is into the Olecranon Ulnæ.—The use of the Triceps is to extend the fore-arm.

- 24 The Anconeus arises from the posterior part of the external Condyle of the Humerus.—It is inserted into a ridge on the outer and posterior part of the upper end of the Ulna.—Its use is to extend the fore-arm.
- 25 The Brachialis Internus arises from the middle of the Os Humeri, around the insertion of the Deltoid, and from the Intermuscular Ligament; passing over the Capsular Ligament of the Elbow Joint, --it is inserted into the Coronoid process of the Ulna.-Its use is to bend the fore-arm, and to pull upward the Capsular Ligament.
 - 26 The Supinator Radii Longus arises from the ridge above the external Condyle of the Os Humeri, as far up as the middle of the bone.— It is inserted into the outer side of the inferior end of the Radius.——Its use is to bend the Elbow Joint, and to supinate the Hand.
- Condyle of the Os Humeri, and from the external upper part of the Ulna, adhering to the Capsular Ligament.—It is inserted into the Neck and Tubercle of the Radius, and into the ridge running from that downward and outward.—Its use is to supinate the Hand.
- 28 The PRONATOR RADH TERES arises from the Internal Condyle of the Humerus, and likewise from the Coro-

Answ.

- noid process of the Ulna.—It is inserted into the middle of the outside of the Radius.—Its use is to pronate the Hand.
- 29 Six Muscles arise from the Humerus, and are inserted into the Hand, viz. the Flexor Carpi Ulnaris, Palmaris Longus, Flexor Carpi Radialis, Extensor Carpi Radialis Brevior, and Extensor Carpi Ulnaris.
- dyle of the Humerus, the outer side of the Olecranon, and the Fascia of the Fore-arm.—It is inserted into the Os Pisiforme, and Metacarpal Bone of the little Finger.—Its use is to bend the arm and wrist joints.
- of the Humaris Longus arises from the inner Condyle of the Humarus. --It is inserted into the Carpal Ligament, and Aponeurosis Palmaris.---Its use is to bend the Wrist, and to stretch the Aponeurosis.
- Condyle of the Humerus, and from the upper end of the Ulna anteriorly; adhering to the Capsular Ligament,---it is inserted anteriorly, into the upper end of the Metacarpal Bone of the Forefinger, having passed through a groove of the Trapezium.---Its use is to bend the Wrist and Elbow Joints.
- 33 The Extensor Carpi Radialis Longion arises from the lower part of the external ridge of the Humerus, above its external Condyle.—It is inserted posteriorly, into the upper end of the Metacarpal Bone of the

Answ.

Forefinger.---Its use is to extend the Wrist Joint, and occasionally to bend the Elbow Joint.

- 34 The Extensor Carpi Radialis Brevior arises from the external Condyle of the Humerus, and from the external lateral Ligament of the Elbow Joint.---It is inserted posteriorly, into the upper part of the Metacarpal Bones of the fore and middle Fingers.—Its use is to extend the Wrist Joint.
- Condyle of the Humerus, and from the middle of the Ulna, through the groove, at the extremity of which it passes.—It is inserted posteriorly, into the upper end of the Metacarpal Bone of the little Finger.—Its use is to extend the Wrist Joint.
- 36 Three Muscles, viz. the Flexor Digitorum Sullimis Perforatus, Flexor Longus Pollicis, and Extensor Digitorum Communis arise from the Humerus, and are inserted into the Fingers.
- from the inner Condyle of the Humerus, the Coronoid process of the Ulna, the Tuberosity of the Radius, and the middle of the Forepart of the Radius, it sends off four Tendons.—It is inserted anteriorly into the upper end of all the bones of the second Phalanx, dividing near the ends of the first bones for the passage of the Tendons of the Perforans.—Its use is to bend the first and second joints of the Fingers, the Wrist, and the Elbow Joint.
- 38 The FLEXOR LONGUS POLLICIS arises from the inner Condyle of the Humerus, and from the anterior side

Answ.

of the Radius below the Tuberosity.—It is inserted into the last bone of the Thumb.—Its use is to bend the last Joint, and also the Wrist Joint.

- The Extensor Digitorum Communis arises from the external Condyle of the Humerus, adhering to the Supinator Brevis; it divides into four Tendons, which are connected by small transverse ones upon the back of the hand.—It is inserted into the posterior part of all the bones of the Fingers.—Its use is to extend all the joints of the Fingers, the Wrist, and the Elbow Joint.
- 40 The FLEXOR DIGITORUM PROFUNDUS PERFORANS,
- Arises from the upper, anterior and outer part of the Ulna, and from part of the Interosseous Ligament.—It is inserted, after passing behind the Flexor Sublimis and Annular Ligament, (its Tendons perforating those of the above mentioned Muscle,) anteriorly into the root of the last bone of each finger.—Its use is to bend the joints of the Fingers and the Wrist Joint.
- 42 The LUMBRICALES are four in number, of these
- Profundus.—It is inserted into the inside of the first joint of the finger, and into the back of each of the other joints.—Their use is to Adduct these fingers, to bend their first joint and to extend the rest.
- 44 Five Muscles, viz. the Extensor Ossis Metacarpi Pollicis, Extensor Primi Internodii Pollicis, Extensor Secundi Internodii Pollicis, Flexor Longus Pollicis, and Indi-

Answ

cator, arise from the Forearm, and are inserted into the Fingers.

- 45 The Extensor Ossis Metacarpi Pollicis arises posteriorly from the middle of the Ulna, from the middle of the Radius, and from the Interosseus Ligament.—
 It is inserted into the Trapezium and Metacarpal Bone of the Thumb.—Its use is to extend the Wrist Joint, and the Metacarpal Bone of the Thumb.
- the posterior part of the Ulna and the Interosseous Ligament.—It is inserted into the back of the first and second bones of the Thumb.—Its use is to extend the Wrist, the Metacarpal and the first bone of the Thumb.
- posteriorly from the middle of the Ulna, and from the Interosseous Ligament, and its tendon passes through a groove at the lower end of the Radius.—It is inserted into the last bone of the Thumb.—Its use is to extend the Wrist and the last joint of the Thumb.
- 48 Vide No. 38 for the Flexor Longus Pollicis.
- 49 The Indicator arises posteriorly from the middle of the Ulna.—It is inserted into the posterior part of the Forefinger.—Its use is to extend the Forefinger.
- 30 The Pronator Quadratus is the only Muscle which
- 51 Arises from the lower and inner part of the Ulna.—It is inserted into the lower and anterior part of the Radius.—Its use is to pronate the Hand.
- 52 The PALMARIS BREVIS, is the only Muscle which

Answ.

- 53 Arises from the Apeneurosis Palmaris, and Ligamentum Annulare.--It is inserted into the Os Pisiforme, and into the Integuments covering the Abductor Minimi Digiti,---Its use is to aid in contracting the Palm.
- 54 Three Muscles arise from the Wrist, and are inserted into the Thumb, viz. the Abductor Pollicis, Flexor Ossis Metacarpi Pollicis, and Flexor Brevis Pollicis.
- 35 The Abductor Pollicis arises from the Annular Ligament and Os Trapezium.—It is inserted into the outside of the root of the first bone.—Its use is to draw the Thumb toward the Finger.
- the Trapezium and Annular Ligament lying under the Abductor.—It is inserted anteriorly into the lower end of the Metacarpal Bone of the Thumb.—Its use is to draw the Thumb toward the Finger.
- zoides, Magnum and Unciforme of the Carpus, being divided by the Flexor Longus.—It is inserted into the Ossa Sessamoidea, and first bone of the Thumb.—Its use is to bend the first joint of the Thumb.
- 58 The Abductor Indicis,
- Metacarpal Bone of the Thumb.—It is inserted into the outward and back part of the first bone of the Index.—Its use is to approximate the Thumb and Forefinger.
- 60 Three Muscles arise from the Wrist, and are inserted into the Little Finger, viz. the Abductor Minimi Digita

Answ.

Manus, Adductor Metacarpi Minimi Digiti, and Flexor Parvus Minimi Digiti.

- 61 The Abductor Minimi Digiti Manus arises from the Os Pisiforme and Annular Ligament.—It is inserted into the outer side of the upper end of the first bone of the little Finger.—Its use is to draw this finger from the rest.
- the Process of the Unciforme, and from the Annular Ligament.—It is inserted into the inside and anterior part of the Metacarpal Bone of the Forefinger.—Its use is to draw the Metacarpal Bone of this finger toward the rest.
- outside of the Os Unciforme and Annular Ligament.—
 It is inserted into the inner and anterior part of the upper end of the first bone of this finger.—Its use is to bend the first joint, and to assist the Adductor.
- 64 The Adductor Pollicis,
- 65 Arises from all the length of the Metacarpal Bone of the middle Finger.—It is inserted into the inner part of the root of the first bone. Its use is to draw the Thumb toward the Finger.
- 66 Seven Muscles arise from the Metacarpus, and are inserted into the Fingers, viz. the Prior Indicis, Posterior Indicis, Prior Medii, Posterior Medii, Prior Annularis, Posterior Annularis, and Interosseous Auricularis.
- 67 The Prior Indices arises from the upper anterior part of the Metacarpal Bone of the Forefinger.—It is

Answ.

inserted into all the posterior part of the Forefinger. Its use is to Abduct the Forefinger, to bend the first joint and to extend the rest.

- 68 The Posterior Indicis arises from the root and inner part of the Metacarpal Bone of the Forefinger.—It is inserted into all the posterior part of the Forefinger.

 Its use is to Abduct the Forefinger, to bend the first joint and to extend the rest.
- Bones of the fore and middle Fingers.—It is inserted into all the posterior part of the little Finger. Its use is to draw the middle Finger toward the Thumb, to bend the first, and to extend its other joints.
- 70 The Posterior Medii arises from the roots of the Metaearpal Bones that sustain the middle and ring Fingers.—It is inserted into all the posterior part of the middle Finger. Its use is to draw the middle Finger outward, to bend its first, and to extend its other joints.
- 71 The PRIOR ANNULARIS arises from the anterior part of the root of the Metacarpal Bone of the ring Finger.—
 It is inserted into all the posterior part of the ring Finger. Its use is to Abduct the ring Finger, to bend its first, and to extend its other joints.
- The Posterior Annularis arises from the roots of the Metacarpal Bones of the ring and little Fingers.

 It is inserted into all the posterior part of the ring Finger. Its use is to Abduct the ring Finger, to bend its first, and to extend its other joints.

Answ.

73 The Interesseus Auricularis arises from the anterior part of the root of the Metacarpal Bone of the little Finger.—It is inserted into all the posterior part of the little Finger. Its use is to Abduct the little Finger, to bend its first, and to extend its other joints.

SECTION XXII.

MUSCLES OF THE LOWER EXTREMITY.

- 1 The Psoas Magnus is the only Muscle which
- 2 Arises from the side of the body and transverse process of the last Vertebra of the Back, and from the same parts of all the Lumbar Vertebræ.—It is inserted into all the Trochanter Minor of the Femur, and some way below it. Its use is to bend the Thigh, or the Lumbar Vertebræ upon the Pelvis.
- 3 Thirteen Muscles arise from the Pelvis, and are inserted into the Femur, viz. the Gluteus Maximus, Gluteus Medius, Gluteus Minimus, Pyriformis, Obturator Internus, Gemini, Quadratus Femoris, Iliacus Internus, Pectinalis, Obturator Externus, Adductor Longus Femoris, Adductor Brevis Femoris, and Adductor Magnus Femoris.
- 4 The GLUTEUS MAXIMUS arises from the posterior past of the Crista Ilii, from the side of the Sacrum, below its junction with the Ilium, from the posterior Sacro-Ischiatic Ligament, and from the Os Coccygis. It passes over the posterior part of the Trochanter Major.

Answ.

and is connected to the Fascia of the Thigh.—It is inserted into the upper and outer part of the Linea Aspera. Its use is to extend the Thigh.

- 5 The GLUTEUS MEDIUS arises from the anterior superior Spinous process of the Ilium, anteriorly from the outer edge of the spine of the Ilium, and posteriorly from the Dorsum of that bone.—It is inserted into the middle great depression of the Trochanter Major. Its use is to pull the Femur outward and backward, and when bended, to rotate it outward.
- from below the superior anterior Spinous process of the Ilium to its great Notch.—It is inserted into the anterior great depression of the Trochanter Major.

 Its use is to pull the Femur outward and backward, and to rotate it outward.
- The Pyriformis arises internally from the second, third, and fourth false Vertebræ, passing out of the Pelvis, it receives some fibres from the posterior inferior Spine of the Ilium.—It is inserted into the anterior small depression on the top of the Trochanter Major. Its use is to aid in moving the thigh upward, and rolling it outward.
- The Obturator Internus arises from almost all the internal cirumference of the Obturator Foramen, it passes out of the Pelvis between the Tuber Ischii, and the posterior Sacro-Ischiatic Ligament, passing also over the Capsular Ligament of the hip joint it is sheathed by the Gemini.—It is inserted into the pos-

Answ.

terior small depression on the top of Trochantor Major. Its use is to roll the Femur obliquely outward.

- 9 The Gemini arise, the superior from the Spine, and the inferior from the Tuberosity of the Ischium, and in their course they form a sheath for the Obturator Internus.—They are inserted into the posterior part of the top of the Trochanter Major on each side the Obturator Internus. Their use is to roll the Thigh outward, and to retain the Tendon of the Obturator.
- the Tuber Ischii.—It is inserted posteriorly into a ridge between the great and small Trochanter. Its use is to roll the Thigh outward.
- Ilium, and also from the Transverse process of the last Lumbar Vertebra.—It is inserted into the Trochanter Minor. Its use is to bend the Thigh.
- of the Os Pubis.—It is inserted into the anterior upper part of the Linea Aspera. Its use is to bring the Thigh upward and inward, and to rotate it in some degree outward.
- The Obturator Externus arises from the inferior anterior part of the Pubis, from the fore part of the Crus of the Ischium, and from the external margin of the Obturator Foramen.—It is inserted into the Cavity behind the Trochanter Major, adhering to the Capsular Ligament. Its use is to roll the Femur out-

Answ.

ward, and to prevent the Capsular Ligament from being pinched.

- 14 The Adductor Longus Femoris arises from the superior anterior part of the Os Pubis, and from its Symphysis, internally to the Pectinalis.—It is inserted near the middle of the Linea Aspera. Its use is to pull the Femur inward and upward, and, in some degree, to rotate it outward.
- 15 The Adductor Brevis Femoris arises from the Pubis near its Symphysis, below and behind the Adductor Longus Femoris.—It is inserted into the upper part.

 of the Linea Aspera, above the insertion of the Adductor Longus Femoris. Its use is similar to that of the Adductor Longus Femoris.
- physis, more inferiorly than the Adductor Brevis
 Femoris, and from the Tuber Ischii.—It is inserted
 into almost all the length of the Linea Aspera, into
 the ridge leading from that to the Internal Condyle,
 and into the Condyle itself. Its use is to pull the
 Femur inward and upward, and, in some degree, to
 rotate it outward.
- 17 The Tensor Vaginæ Femoris,
- 18 Arises externally from the anterior superior Spinous process of the Ilium.—It is inserted a little below the Trochanter Major into the inside of the Fascia of the Thigh. Its use is to stretch the Fascia, to Abduct the Thigh, and rotate it outward.
- 19 Six Muscles arise from the Pelvis, and are inserted into

Answ.

the Leg, viz. the Rectus Cruris, Sartorius, Gracilis, Semitendinosus, Semimembranosus, and Long Head of Biceps.

- Spine of the Ilium, and from the Dorsum of the same bone.—It is inserted into the Patella, and subsequently into the anterior Tuberosity of the Tibia. Its use is to bend the Thigh and to extend the Leg.
 - of the Ilium, and passes inwardly.—It is inserted into the inner anterior side of the upper end of the Tibia.

 Its use is to elevate the Thigh and to turn it outward, and to bend the Leg inwardly.
 - 22 The Gracilis arises from the Symphysis Pubis.—It is inserted into the Tibia behind the Sartorius. Its use is to Adduct the Femur, and to bend the Knee.
 - 23 The Semitendinosus arises conjoined with the long head of the Biceps, from the upper part of the Tuber Ischii.—It is inserted into the Tibia behind the Sartorius. Its use is to extend the Thigh and bend the Leg.
 - 24 The Semimembranosus arises from the upper part of the Tuber Ischii.—It is inserted into the inner and back part of the head of the Tibia. Its use is to extend the Thigh and to bend the Leg.
 - 25 The Long Head of the Bicers arises conjointly with the Semitendinosus, from the upper part of the Tuber Ischii.—It is inserted into the top of the head of the

Ausw.

Fibula. Its use is to extend the Thigh and bend the Leg.

- 26 Five Muscles arise from the Femur, and are inserted into the Leg, viz. the Cruralis, Vastus Externus, Vastus Internus, Short Head of the Biceps, and Popliteus.
- of the Femur, and is connected to the Femur downward, and to both Vasti.——It is inserted into the upper part of the Patella, and by means of its Ligament into the Tuberosity of the Tibia. Its use is to extend the Leg.
- 28 The Vastus Externus arises from the root of the Trochanter Major, and whole length of the Linea Aspera. It is inserted similarly to the Cruralis, but more externally. Its use is to extend the Leg.
- Trochanter Minor and anterior part of Femur, and from all the length of Linea Aspera.—It is inserted like the Cruralis, but more internally. Its use is to extend the Leg.
- Aspera, below he insertion of the Gluteus Maximus.

 It is inserted into the top of the Head of the Fibula.

 Its use is to bend the Leg.
- of the external Condyle of the Femur, adhering to the Capsular Ligament.—It is inserted into a ridge at the upper and internal part of the Tibia. Its use is to bend

Vol. II.

Anws.

- the Leg, and prevent the Capsular Ligament from being pinched.
- 32 Two Muscles, viz. the Gastrochemius, and Planta is, arise from the Femur, and are inserted into the Foot.
- 33 The GASTROCNEMIUS arises by two heads, one from the superior and posterior part of the internal Condyle of the Femur, the other from the same part of the External. It is inserted into the Tendon of the Soleus. Its use is to bend the Knee and to aid the Soleus.
- the root of the external Condyle of the Femur, adhering to the Capsular Ligament of the Knee Jont in its descent.—It is inserted into the inside of the posterior part of the Os Calcis, below the Tendo Achillis.

 Its use is to aid in bending the Knee, and in extending the foot, and to prevent the Capsular Ligament being pinched.
- 55 Six Muscles arise from the Leg, and are inserted into the Foot, viz. the Soleus, Tibialis Posticus, Peroneus Longus, Peroneus Brevis, Tilialis Anticus, and Peroneus Tertius, or Nonus Vesalii.
- the Fibula, from that bone some way downward, and also from the posterior and middle part of the upper end of the Tibia, and from the same bone more internally.—It is inserted by its Tendon (named Tendo Achillis) into the posterior part of the Os Calcis. Its use is to extend the Foot.
- 37 The TIBIALIS Posticus arises from the anterior and upper

Answ.

part of the Tibia, and, (passing through the Interosseous Ligament,) from the back of the Fibula, from a great portion of the back of the Tibia superiorly, and from the Interroseous Ligament; its tendon passes in a groove behind the Malleolus Internus.——It is inserted into the upper and inner part of the Os Naviculare, thence into the Cuneiforme Internum and Medium. Its use is to extend the Foot and to turn the Toes inward.

- and externally from the body of the Fibula, almost as far down as the Ancle, its tendon passing through a groove in the posterior part of the lower end of the Fibula, on the outside of the Os Calcis, and on the inferior part of the Os Cuboides.—It is inserted into the Os Cuneiforme Internum, and into the outside of the root of the Metatarsal Bone of the great Toe. Its use is to extend and to move the Foot outward.
- The Paroneus Brevis arises from above the middle of the external part of the Fibula.—It is inserted externally into the root of the Metatarsal Bone of the little Toe. Its use is to assist the Peroneus Longus.
- 40 The Tibialis Anticus arises from the outside of the anterior Tuberosity of the Tibia, from the outside of the bone itself, and from the Interrosseous Ligament, its tendon passing under the annular Ligament of the Tarsus.—It is inserted into the inner part of the Os Cuneiforne Internum, and root of the Matatarsal

Answ.

Bone of the great Toe. Its use is to bend the Foot, and turn the Toes inward.

- 41 The Peroneus Tertius, or Nonus Vesalli, arises from the middle of the Fibula, almost to its inferior extremity.—It is inserted into the root of the Metatarsal Bone of the little Toe. Its use is to assist in bending the Foot.
- 42 Four Muscles arise from the Leg, and are inserted into the Toes, viz. the Extensor Longus Digitorum Pedis, Extensor Proprius Pollicis Pedis, Flexor Longus Digitorum Pedis Profundus Perforans, and Flexor Longus Pollicis Pedis.
 - the anterior inner part of the head of the Fibula, from the anterior outer part of the head of the Tibia, from the Interroseous Ligament, and from the Fascia of the Leg, also from the anterior Spine of the Fibula. It is inserted into all the Phalanges of the four lesser Toes. Its use is to bend the Ancle Joint, and to extend all the joints of the Toes into which it is inserted.
 - 44 The Extensor Propries Pollicis Pedis arises from the anterior part of the Fibula, some way below its head, to nearly its lower extremity.—It is inserted into the posterior part of both the bones of the great Toe. Its use is to hend the Ancle Joint, and to extend the great Toe.
 - 45 The FLEXOR LONGUS DIGITORUM PEDIS PROFUNDUS
 PENTORANS arises from the 6 lique ridge on the

Anws.

upper back part of the Tibia, and from the inner and outer edges of this bone, enclosing the Tibialis Posticus by its fibres, and afterwards passing through a groove of the Os Calcis, it divides into four Tendons, which run through those of the Perforatus. It receives a slip of Tendon from the Flexor Pollicis Longus.—It is inscrted into the extremity of the last joint of the four lesser Toes. Its use is to extend the Ancle Joint, to turn the Foot inward, and to bend the Toes.

- from below the head of the Fibula, being continued almost to its inferior extremity.—It is inserted into the posterior part of both the bones of the great Toe.

 Its use is to extend the Ancle Joint, and to bend the great Toe.
- 47 Three Muscles arise from the Tarsus and Metatarsus, and each is inserted into the Toes generally, viz. the Extensor Brevis Digitorum Pedis, Flexor Brevis Digitorum Pedis, and Flexor Digitorum Accessorius, or Massa Carnea Jacobi Sylvii.
- The Extensor Brevis Digitorum Pedis arises from the anterior and upper part of the Calcaneum, lying under the tendons of the Extensor Longus.——It is inserted into the posterior part of all the Toes, except the little one. Its use is to extend the Toes.
- 49 The FLEXOR BREVIS DIGITORUM PED:s arises between the Abductors of the little and great Toes, from protuberances upon the inferior posterior part of the Calcaneum.—It is inserted by four Tendons into the

Anws.

second Phalanx of the four lesser Toes: that of the little toe is sometimes wanting. Its use is to bend the first and second Joints of the four lesser Toes.

- CARNEA JACOBI SYLVII, arises from the external Tuberosity of the Calcaneum, and from a great part of its internal concavity.—It is inserted, by means of the tendons of the Flexor Longus, which it joins at its division. Its use is to assist the Flexor Longus.
- 51 The LUMBRICALES PEDIS,
- Flexor Profundus, near the insertion of the Massa Carnea, and just before its division.—They are inserted, by four Tendons, into the internal posterior part of the four lesser Toes. Their use is to draw the Toes inward, and to bend their first joint and to extend the rest.
- and are inserted into the Toes, viz. the Adductor Pollicis Pedis, Flexor Brevis Pollicis, Abductor Pollicis Pedis, Adductor Minimi Digiti Pedis, Flexor Brevis Minimi Digiti Pedis, Abductor Minimi Digiti Pedis, Adductor Indicis Pedis, Adductor Indicis Pedis, Abductor Indicis Pedis, Adductor Medii Digiti Pedis, Abductor Medii Digiti Pedis, Abductor Medii Digiti Pedis, Adductor Tertii Digiti Pedis, and Abductor Tertii Digiti Pedis.
- 34. The Adductor Pollicis Pedis arises from the inner protuberance of the Calcaneum, and from the same bone where it joins the Naviculare.—It is inserted

Answ.

- into the Os Sessamoideum Internum, and the base of the first bone of the great Toe. Its use is to Adduct the great Toe.
- anterior part of the Calcaneum, where it joins the Cuboides, and from the Cuneiforme Externum; being internally connected with the Abductor and Adductor.—It is inserted into the Os Sessamoideum Externum, and base of the first bone of the great Toe. Its use is to bend the first joint.
- neum, Cuboides, Cuneiforme Externum, and the base of the Metatarsal Bone of the second Toe.—
 It is inserted into the Os Sessamoideum Externum, and the base of the Metatarsal Bone of the great Toe.

 Its use is to Abduct the great Toe.
- The Adductor Minimi Digiti Pedis arises from the inside of the root of the Metatarsal Bone of the little Toe.—It is inserted into the inside of the base of the first bone of the little Toe. Its use is to Adduct the little Toe.
- the Cuboides near the groove of the Peroneus Longus, and from the outside of its own Metatarsal Bone. It is inserted into the top of the Metatarsal Bone, and base of the first bone of the little Toe. Its use is to bend the first joint of the little Toe.
- 59 The Abductor Minimi Digiti Pedis arises from before the external protuberance of the Calcaneum,

Ausw.

and from the root of the Metatarsal Bone of the little Toe.—It is inserted into the base of the first bone of the little Toe. Its use is to Abduct the little Toe.

- the base of the Metatarsal Bone of the fore Toe, from the outside of the base of the Metatarsal Bone of the great Toe, and from the Cuneiforme Internum.—It is inserted into the inside of the base of the first bone of the fore Toe. Its use is to Adduct the fore Toe.
- of The Abductor Indicis Pedis arises from the base of the Metatarsal Bones of the fore and second Toes.—It is inserted into the outside of the base of the first bone of the fore Toe. Its use is to Abduct the fore Toe.
- 62 The Adductor Medii Digiti Peris arises from the inside of the base of the Metatarsal Bone of the middle Toe.—It is inserted into the inside of the base of the first bone of the middle Toe. Its use is to Adduct the middle Toe.
- bases of the Metatarsal Bones of the second and third Toes.—It is inserted into the outside of the base of the first bone of the second Toe. Its use is to Abduct the second Toe.
- 64 The Adductor Terth Dieiti Pedis arises from the inner and under part of the base of the Metatarsal Bone of the third Toe.—It is inserted into the inside of the base of the first bone of the third Toe. Its use is to Adduct the third Toe.
- Gs The Abductor Tertii Diciti Pedis arises from the

Sect. XXIII.

BURSÆ MUCOSÆ.

Answ

roots of the Metatarsal Bones of the third and little Toes.—It is inserted into the outside of the base of the first bone of the third Toe. Its use is to Abduct the third Toe.

- 66 The Transversalis Pedis, from one Metatarsal Bone to another,
- Bone of the great Toe, and from the Os Sessamoideum Internum.—It is inserted inferiorly and externally, into the anterior end of the Metatarsal Bone of the little Toe, and the Ligament of the next one.— Its use is to contract the Foot from side to side.

SECTION XXIII.

BURSÆ MUCOSÆ.

- The Bursæ Mucosæ are, as their name expresses, mucous bags of a delicate transparent texture, and whose internal surfaces are lubricated by a synovial fluid.
- They answer the purpose of friction Bags, allowing the ready play of tendons over bone, &c.
- tendons, which rub against each other; or where they play on the surface of boncs, or joints, and between the integuments and certain prominent points of bone, viz. at the knee, elbow, and knuckles.

Sect. XXIV.

FASCIÆ

Answ.

- 4 The structure of the membrane which forms them resembles that of the Synovial membrane of Joints.
- 5 They adhere with great firmness to the parts betwixt which they lie.
- 6 Their internal surfaces are in contact, and are only lubricated by the Synovial fluid which is formed in them.

SECTION XXIV.

FASCIÆ.

- 1 The FASCIT, or APONEUROSES, are tendinous expansions, which brace and protect the muscles whilst in action, and support the form of parts.
- 2 The most extensive and important are the Temporal Fascia, the Fascia of the Arm, the Fascia of the Forearm, the Palmar Fascia, the Femoral Fascia, the Fascia of the Leg, and the Plantar Fascia.
- 3 The Temporal Fascia is attached to the Temporal ridges of the Os Frontis and Os Parietale, and the upper edge of the Zygoma, and posterior edge of the Os Malæ, and Temporal process of the Os Frontis.
- 4 The Fascia of the Arm is much thinner than that of the Forearm, from which it receives a considerable addition.
- 5 The FASCIA OF THE FOREARM is chiefly derived from the tendon of the Biceps.
- 6 The Palmar Fascia proceeds from the internal annular Ligament, and the tendon of the Palmaris Longus.

Sect. XXV. THORACIC VI-CERA.

Anws

- The FEMORAL FASCIA, or FASCIA LATA, is derived from the Tensor Vaginæ Femoris, and Glutæus Maximus.
- * The Brachial Fasciæ are strongest on the inner and anterior part of the Forearm, and the Fascia Lata exceeds all the others in density at the outer part of the Thigh.

SPLANCHNOLOGY.

- 1 Splanchnology treats of the structure of the Viscera and Organs of the Senses.
- 2 The Viscera are chiefly situated in the great Cavities of the body, viz.
- 3 The Cavity of the CRANIUM, the THORAX, and the AB-

SECTION XXV.

THORACIC VISCERA.

- 1 The Thorax is placed between the Neck and the Abdomen.
- The hard parts composing it are the Dorsal Vertebræ, the Ribs and Sternum; the soft parts are the Pleura, the Intercostal Muscles, and the Diaphragm.
- 3 It is of a conical figure.
- 4 The Viscera of the Thorax are, the Pleura, the Thymus Gland, the Heart and great Vessels, and the Pericardium; the Lungs, and the Esophagus.

Sect. XXV. THORACIC VISCERA.

PLEURA.

Answ.

- 5 The PLEURA lines the cavity of the Thorax, and closely invests the Lungs.
- 6 It is a thin, transparent Membrane, its outer Surface is adherent to the Thorax and Lungs; its inner Surface is smooth and lubricated.
- 7 The use of this membrane is to afford a smooth and firm covering to the Lungs, and a lining to the Cavity of the 'Thorax, and to subdivide this into two Cavities.
- This it effects by its duplicature, called, The Medias-
- The Portions of the Pleura, which line the Parieties of the Thorax on each side, meet behind the Sternum, unite, and forming a double membrane, are reflected directly backwards; they then separate to invest the Heart, Pericardium, and great vessels; they give off the covering to the Lungs; and then, behind the Heart, they again approach each other and pass to the bodies of the Vertebræ, so that in fact there are two Pleuræ, one for each side.
- 10 In this Duplicature there are three Cavities, viz. the Anterior, Posterior, and middle Cavities of the Mediastinum.
- 11 The Anterior Cavity contains the Thymus Gland in the Fœtus.
- 19 The Heart and Pericardium occupy the middle Cavity.
- 13 The Posterior Cavity contains the Bronchia, Esophagus,

Answ.

Descending Aorta, and beginnings of the intercostal arteries, the Descending Cava, the Vena Azygos, the Thoracic Duct, the Par Vagum, and Great Sympathetic Nerve.

- 14 The Mediastinum, at its attachment to the posterior part of the Sternum, is placed a little to the left side.
- 15 That part of the Pleura, which covers the Lungs, has been called *Pleura Pulmonalis*; where it lines the Thorax, *Pleura Costalis*; and its outer surface, its Cellular Portion.
- 16 It is lubricated by a serous fluid which transudes from its pores.
- 17 The Pleura derives its Arteries chiefly from the Intercostals and Bronchial.
- 18 Its Veins pass to those which correspond with the Arteria in name and distribution.
- 19 Its Nerves are from the Intercostals.

THYMUS GLAND.

- 20 The THYMUS GLAND is situated in the superior part of the anterior Cavity of the Mediastinum.
- 21 It is of an oblong figure, having two processes above and two below.
- 22 It has the appearance of a glandular Structure.
- 23 In the Foetus it is of considerable size; but in the adult there hardly remains a vestige of it.
- Its use (which is unknown) appears to be confined to the foctal state.

PERICARDIUM.

Answ.

- 25 The Pericardium is a firm membranous bag which
- 26 Surrounds the Heart.
- 27 It is a mewhat conical, corresponding to the figure of the Heart.
- 28 It consists of three Laminæ, of which the middle one is composed of dense tendinous filaments; the inner one is a continuation of the outer coat of the Heart; and the outer one is derived from the Pleura.
- 29 It adheres firmly to the tendinous part of the Diaphragm, and to the great vessels at the base of the Heart; the beginning of which it includes within its Cavity.
- 40 Its internal surface is tubricated by a serous fluid transuding from the exhalents.
- takes place after death, affords a sensible quantity of it, it is called the Liquor Pericardia.

HEART.

- 32 The Heart is a hollow muscular organ, which receives the blood from, and transmits it to, all the parts of the body.
- 33 Invested by the Pericardium, it is situated between the Lungs, and rests on the superior part of the Diaphragm.

Answ.

- 34 It is somewhat of a conical form, flatted however on its inferior surface, and rounded at its upper part.
- 35 It is divided into a Basis, turned backwards and upwards; an Apex, pointing forward and to the left side; a rounded Edge to the right; a more acute Edge to the left; a superior convex Surface; and an inferior flat Surface.
- 36 It is internally divided into FOUR CAVITIES, viz. two Anricles as its base, and two Ventricles forming its body.
- nor any betwixt the two Ventricles; but the right Auricle communicates with the right Ventricle, and there is a similar opening betwixt the left Auricle and the left Ventricle; the two sides of the Heart are therefore distinct.
- 38 The Auricles receive the blood from the great veinous trunks which are fixed to them, and transmit it to the Ventricles.
- 39 The VENTRICLES have each a large artery into which they propel the blood in a manner and for purposes to be hereafter described.

RIGHT AURICLE.

- 40 The right Auricle is situated toward the anterior part of the base of the Heart.
- 41 The SEPTUM AURICULARUM divides it from the left.
- 42 The transverse fleshy fibres on the sides of the Auricle are called the Musculi Pectinati.

Answ.

- 43 The two Venæ Cavæ, and the Coronary Vein open into this Auricle.
- 44 There is an irregular Appendix of the Auricle communicating with its Cavity.
- The Superior Vena Cava opens into its upper posterior part.
 - 46 The Inferior Vena Cava opens into its lower posterior part.
 - 47 Between the mouths of the Venæ Cavæ there is an angular projection, called Tuberculum Loweri.
 - 48 The Coronary Vein enters toward the inner and inférior part;
 - 49 Its opening is protected by a considerable semilunar Valve.
 - brane, situated to the left of the opening of the inferior Cava.

RIGHT VENTRICLE.

- of the right side of the Heart.
- 32 It is larger than the left, though its parieties are thinner.
- 53 The fleshy pillars, by the contraction of which the valves of the Ventricles are closed, are called Carnea Columnae.
- The Tendons of the Carneæ Columnæ, by which they are connected to the edges of the valves, are called *Cordæ-Tendineæ.

Answ

- 55 The TRICUSPID VALVE is placed at the opening between the right Auricle and Ventricle.
- 56 It is a tendinous curtain, fixed around the circular opening into the Ventricle; its opposite edge presents three points, which are connected to the sides of the Ventricle by tendinous cords.
- 57 When the Ventricle contracts, this Valve prevents the blood from returning into the Auricle.
- 53 At its upper and left side is situated the opening of the Pulmonary Artery.
- 59 At this part three Semilunar Valves are placed.
- 60 The loose Edge of each resembles two small crescents, uniting in a middle Papilla, called Corpus Sesamoideum Aurantii.
- 61 These Vulves support the column of blood in the Artery, and prevent its returning into the Ventricle.

LEFT AURICLE.

- 62 The LEFT AURICLE is situated at the superior and posterior part of the left side of the Heart.
- 63 This cavity is smaller than the right, but its sides are thicker.
- 64 Its general structure resembles that of the right Auricle.
- 65 The four Pulmonary Veins open into this Auricle.

LEFT VENTRICLE.

Answ.

- 66 The Left Ventricle is situated at the posterior and left part of the Heart.
- 67 Its general structure is similar to the right.
- 48 The MITRAL VALVE is placed at the opening to the Auricle.
- on The Mitral Valve resembles the Tricuspid in situation, use and structure, and differs from it only in being divided into two portions only, which has occasioned it to be compared to a Bishop's Mitre.
- 70 At the upper and fore part is the Opening of the Aorta.
- 71 This is guarded by three Semilunar Valves.
- 72 Their structure and use exactly correspond with those of the Pulmonary Artery.

ARTERIES, VEINS, AND NERVES OF THE HEART.

- 73 The TWO CORONARY ARTERIES, which nourish the substance of the Heart, are derived from the commencement of the Aorta, immediately behind its Semilunar Valves;
- 74 That which supplies the right side runs between the right.

 Auricle and Ventricle; the left passes between the
 Pulmonary Artery and left Ventricle, and divides into
 branches.
- 75 The CORONARY VEIN opens into the right Auricle.
- 76 Its NERVES are derived from the Cardiac Plexus.

TRACHEA.

Answ.

- 77 The TRACHEA is situated anteriorly in the lower part of the Neck and in the Thorax, behind the Thymus Gland, between the two Pleuræ in the space left superiorly between the duplicature of the Mediastinum.
- 78 It is of a tubular form, flatted posteriorly,
- 79 It consists anteriorly of Segments of cartilagenous Circles, forming an incomplete canal, which is membranous posteriorly.
- \$0 At its termination it divides into two Tubes of similar structure, called the Bronchie.
- *1 This division takes place behind the curvature of the Aorta.
- 82 A very irritable mucous membrane lines the Trachea.
- \$3 It has four coats, including the internal lining.
- \$4 The External, or Cellular Coat, is a continuation of the cellular covering of the Lungs.
- The Second Coat is the internal Perichondrium to Cartilages.
- so The Third Coat, which has been thought muscular, completes the circumference of the cartilaginous circles.

LUNGS.

\$7 The Lungs are situated in the cavity of the Thorax, which they chiefly fill.

Answ.

- \$8 They are adapted to the cavity which contains them; being convex next the Ribs, concave next the Diaphragm, and irregularly formed next the Mediastinum and Heart.
 - *9 The Lungs consist of two great lateral parts; or a right and a left Lung, having between them the Heart and Mediastinum. The right Lung is subdivided into three lobes, and the left into two.
 - so At the lower edge of the left Lung there is a notch occasioned by the presence of the Apex of the Heart.
 - of an immense number of small membranous cells.
 - 92 The external covering of the Lungs is a continuation of the Pleura.
 - 93 Within the substance of the Lungs the Broncusar ramify.
 - 94 They are conical tubes, they divide and subdivide.
 - 95 Their minute branches become membranous, and
- 96 They terminate in the Vesicula Bronchialis, or air Cells which are collected
- 97 Into Bundles, called
- 98 Lobuli.
- 99 In structure the Bronchia resemble the Trachea.
- of the Pulmonary Artery and Pulmonary Vein.
- 101 The Interlobular Substance, is the cellular or spungy substance which surrounds the Lobuli, and connects them together.

Answ

102 If this be inflated, the Lobuli are compressed and flattened.

ARTERIES, VEINS, AND NERVES OF THE LUNGS.

- 103 The Blood Vessels of the Lungs are of two kinds, one common, called the Pulmonary Artery and Veins; the other proper, called the Bronchial Arteries and Veins.
- 104 The Pulmoyary Artery divides into two branches, one for each Lung; they take the same course as the Bronchiæ; and, ramifying on the surfaces of the Bronchial Cells, they form a beautiful Plexus, called the Rete Mirabile of Malpighi.
- 105 The Bronchial Arteries are the nutrient vessels of the Lungs.
- 106 Its blood is returned by the Bronchial Veins, which pass
- 107 Irregularly either to the Vena Azygos, or Guttural Vein.
- 108 The Pulmonary Veins receive the blood from the Pulmonary Arteries.
- 109 There are four Pulmonary Veins, two for each Lung;
- 110 They pass to the left Auricle of the Heart.
- 111 The Nerves of the Lungs are derived from the Eighth
 Pair and great Sympathetic.

BRONCHIAL GLANDS.

112 The Bronchial Glands are chiefly situated about the

Sect. XXVI. CORCULATION OF THE BLOOD.

Answ.

termination of the Trachea and beginning of the Bronchiæ.

- 113 They are of various sizes, and usually of a motley blue appearance.
- 114 They are *lymphatic Glands* connected with the absorbent Vessels of the Lungs.

SECTION XXVI.

CIRCULATION OF THE BLOOD.

- 1 The Circulation of the Blood is effected by the alternate contraction of the Aurieles and Ventricles, the Diastole and Systole of the Heart.
- 2 The Diastole is the dilatation of the Ventricles, occasioned by the contraction of the Auricles on their contents.
- The Systole is the contraction of the Ventricles, by which the blood they contain is propelled through all the Arteries.
- 4 The Blood being returned by the Superior Vena Cava, from the upper part of the body, and by the Inferior Vena Cava, from the lower part, is emptied into the right Auricle; this contracts and discharges its contents into the right Ventricle; when completely filled, the right Ventricle contracts, by that contraction its tricuspid valve is shut, and its contents propelled through the ramifications of the Pulmonary Artery in the Lungs. The blood is returned by the four Pul-

Sect. XXVII.

RESPIRATION.

Answ.

monary Veins into the left Auricle, which being distended, now contracts and throws its blood into the left Ventricle; the left Ventricle then also contracts, its mitral valve shuts, and all its blood is propelled through the Aorta into the Capillary Vessels of the System; whence it is again returned by the Veins into the two Venæ Cavæ and the right Auricle, to undergo precisely the same process. The mouths of the Aorta and Pulmonary Artery being each protected by three semilunar valves, the blood is prevented passing back from them into the Ventricles.

The Vernous Blood, which is brought to the right side of the heart, is of a dark purple hue; during its passage through the Lungs it attracts Oxygen from the air in the bronchial cells, and gives out a quantity of Carbonic acid gas; when returned to the left Auricle, it is found of a bright florid red.

SECTION XXVII.

RESPIRATION.

- 1 RESPIRATION consists in inhaling and exhaling the atmospherical air to and from the Lungs, or in Inspiration and Expiration.
- 2 INSPIRATION is thus performed:---The diaphragm contracting descends, and the ribs are raised; thus the cavity of the thorax is suddenly enlarged, which

Answ.

- occasions air to rush in at the Trachea, and fills the cells of the Lungs.
- 3 Expiration is effected by the related on, and consequent ascent of the diaphragm, and descent of the ribs; the capacity of the thorax being thus diminished, the air is expelled from the Lungs.

SECTION XXVIII.

ABDOMINAL VISCERA.

- 1 The Abdomen is situated between the Thorax and Pelvis.
- 2 The Boundaries of this Cavity are above the Drophrigm and the margin of the Chest; behind the five boundar Vertebræ, below the Pelvis; anteriorly and laterally the abdominal muscles.
- It is divided into three Regions; a Superior, or I pagestric Region; a Middle, or Umbilical Region; and an Inferior, or Hypogastric Region.
- 4 The Epigastric Region is all that part which is situated above a line passing from the last rib on one side, across the Abdomen, to the last rib on the other side.
- 5 This Region is subdivided into three other Regions, viz. the Scrobiculus Cords, or Epigastricum, in the middle, and the two Hypochondria on each side, under the edge of the false ribs.
- The Umbilical Region extends equally above and below the navel between the other two.

Ausw.

- 7 It is divided into its middle, or Umbilicus, two lateral regions, called Ilia, or Flanks, and posteriorly the Regio Lumborum.
- * The Hypogastric Region is all that part below a line extending from the superior and anterior Spinous process of the Ossa Ilii.
- 9 Its middle is called the Regio Pubis; its sides the Inguinal Regions. or Groins.
- 10 The whole of this cavity is lined by a thin membrane, called the Peritoneum.
- 11 It contains, besides the Peritoneum, the Organs of Digestion and Chylification, viz. the Stomach, Intestines, Liver, Spleen, and Pancreas.—The Uninary Organs, viz. the Kidnies, Uriters, and Bladder: and lastly, part of the Organs of Generation.

PERITONEUM.

- 12 The Peritoneum adheres to the inner surface of the Abdominal Cavity; it is reflected ever, invests, and supports all its Viscera.
- 13 It is a thin membrane, resembling the Pleura in structure.
- 14 Its outer surface is cellular, and is adherent to the surfaces of the Viscera with which it is in contact.
- 15 Its inner surface is very smooth and polished.
- 16 It is lubricated by a serous fluid discharged from exhalent vessels.
- 17 Its Duplicatures are extensive and numerous; after hav-

Answ.

ing completely invested an organ, the Peritoneum passes, double, to the Parieties of the Abdomen to be here expanded; these duplicatures confine the Organs in their places and support them; they are sometimes called Ligaments; the extensive one, which supports the intestines, is called, the Messentery; and a very large one, hanging loose before the intestines, is called, the Omentum, &c.

- The Processes of the Peritoneum are elongations of it which accompany parts in their exit from the cavity of the Abdomen.
- Peritoneum anteriorly; they are the remains of parts peculiar to the Fœtus, viz. the two Umbilical Arteries, the Umbilical Vein, and the Urachus, to be described hereafter.

STOMACH.

- 20 The STOMACH is a membranous bag, into which the food is received, and where it is digested.
- 21 It is situated obliquely in the left Hypochondrium, and in the Epigastrium.
- 22 It is oblong and incurvated; large at one end, and small at the other.
- 23 Its greater Extremity is situated toward the left side;
- 24 The lesser toward the right side.
- 25 It forms a small curvature superiorly, which is turned rather backward when the stomach is full.

Answ.

- 26 Its greater Curvature is placed inferiorly when empty; rather anteriorly when full.
- 27 It has two openings;
- 28 One is called the CARDIA, the other the Pylorus.
- 29 The CARDIA is situated at the superior part, at a little distance from its greater Extremity.
- 30 The Pylorus is situated at the termination of its lesser Extremity, and at the beginning of the Intestines.
- 31 The Pylorus is situated lower, and turned more forward than the Cardia.
- 32 It has four Coats, viz.
- 33 The Peritoneal, the Muscular, the Nervous, and the Villous Coats.
- 34 The Peritoneal Coat is the most external, it is smooth and lubricated.
- 35 The Muscular Coat is immediately within the Peritoneal.
- 36 It consists of two Planes of fibres; an external and an internal Plane.
- 37 The external Plane is longitudinal.
- 38 The internal Plane of fibres run circularly transverse.
- 39 The Nervous Coat is immediately within the Muscular Coat.
- 40 It is cellular, or filamentary, containing numerous small glands.
- 41 The Villous Coat is the most internal.
- 42 It somewhat resembles the pile of velvet, and is very
- 43 The two internal Coats of the Stomach being more exten-

Answ.

sive than the external, are thrown into folds, called Rugæ.

- 44 They are chiefly placed in a transverse direction.
- The Stomach derives its nerves from the Eighth Pair and great Sympathetic.
- 46 The Arteries of the Stomach come from the Cæliaca.
- 47 Its Veins go to the Vena Portæ.

INTESTINES.

- 48 The Intestines form a long membranous tube, beginning at the Pylorus and ending at the Anus.
- 49 They are divided into the large and small Intestines; THE SMALL being subdivided into, the Duodenum, Jejunum and Ilium; and THE LARGE into Cocum, Colon and Rectum.

DUODENUM. '

- 50 The Duodenum is situated immediately below the Pylorus.
- 51 It is about twelve fingers breadth in length, as its name imports.
- Fall turn.

 The first bends a little backward and downward; then toward the right Kidney; and thence it passes before the Renal Artery and Vein, gradually ascending to the left, before the Aorta and last Dorsal Vertebra; it then continues its course a little forward, making a small turn.

Answ.

- 53 It is retained in its situation by the folds of the Peritoneum, and especially by a transverse duplicature, which gives origin to the Meso-colon.
- 54 The Duodenum, and all the small Intestines, have four Coats resembling those of the Stomach.
- 55 The Peritoneal Coat of the Duodenum does not invest the whole circumference of the Intestine.
- 56 The Muscular Coat of the Duodenum is thicker than in the Jejunum and Ilium.
- 57 The Nervous and Villous Coats of the small Intestines, are much more extensive than the other two, and are thrown into folds, called Valvulæ Conniventes.
- 58 They resemble portions of circular plains having one edge fixed to the Intestine, and the other loose.
- 59 In the Duodenum they are small, but grow much larger and more numerous in the Jejunum, and again decrease in the Ilium.
- 60 The Villi in the Duodenum are much less conspicuous than in the Jejuzum.
- 61 On the short side of its first incurvation there is an opening which is the common Aperture of the Excretory Duct of the Liver, and of the Pancreas.

JEJUNUM AND ILIUM.

There is no mark of distinction between the termination of the Jejunum and the beginning of the Illum, this division is therefore arbitrary. It is usual to consider

Answ.

the superior two fifths as the Jejunum, and the remainder as the ILIUM.

- 63 The Jejunum, beginning at the Duodenum, bends from left to right, and obliquely forward, making several convolutions; it lies chiefly in the upper part of the Umbilical Region.
- 64 The Valvulæ Conniventes and Villi of the Jejunum, are more prominent, loose and floating, than in the Duodenum, and they gradually diminish in the ILIUM.
- 65 Numerous mucous Glands are found in the Jejunum and Illium, in irregular clusters.
- 66 They are most numerous towards the end of the Ilium.

CŒCUM.

- 67 The Cœcum, or Blind Gut, is a short, roomy pouch, into which the Ilium opens.
- 68 It is situated under the right Kidney, upon the Iliacus Internus, its bottom being turned downward.
- 60 A worm-like body is fixed to it, called Appendix Carci Vermiformis;
- 70 It opens not the Cæcum, on the inner side of its bottom; its other Extremity is impervious;
- 71 Its diameter is about a quarter of an inch, and it is about three inches long.
- 72 In structure it nearly resembles the Intestines.
- 73 It has been reckoned by some to secret the odorous matter of the Excrement, but its use is not understood.

COLON.

Answ.

- 74 The Colon, which forms the greater part of the large Intestines, is situated around the small ones, beginning at the Coccum, and ending at the Rectum.
- It ascends in the Right Iliac Region; it then forms the great Arch above the Umbilical Region, crossing from the right Kidney to the lower part of the left Hypochondrium; this arch is situated immediately below the Liver, Gallbladder and Stomach; thence the Colon turns back under the Spleen, runs before the left Kidney, turns toward the Vertebræ, and terminates by a double incurvation.
- 76 This convoluted termination is called, the Sigmoid Flexure.
- 77. At the termination of the Ilium a pair of Valves are situated, called, Valvulæ Coli, or Valvulæ Cæci, or Valvulæ Ilii.
- 78 The opening between these Valves resembles a Fissure, its middle being most open.
- 79 The Colon, as well as the Cœcum and Rectum, has the same number and kind of Coats as the small Intestines.
- lected into three distinct bundles, called, the longitudinal Bands, beginning at the Cœcum; besides these there are occasionally transverse Bands.
- Between these Bands the Intestine bulges out, forming what are called the Cells of the Colon.

Answ.

82 There are many fatty Processes hanging from the outside of the Colon and Cacum, called, Appendices Coli Adiposæ, or Appendices Epiploicæ.

RECTUM.

- 33 The RECTUM, or Straight Gut, extends from the last Lumbar Vertebra to the Anus.
- 84 It runs in a direct course in the hollow of the Os Sacrum and Os Coccygis.
- 85 Its external termination is called, the Anus.
- 86 Its Membranous Coat often contains a great quantity of fat.
- 87 Its Muscular Coat is very thick; its longitudinal fibres are very strong.
- 38 Its Nervous and Villous Coats are larger than in the other Infestines; and form numerous Rugæ,
- 89 Toward the Anus, the Rugæ become longitudinal, and towards the inner margin of the Anus they form little bags, the openings of which are turned upward.
- 90 The Rectum has numerous mucous glands.

MESENTERY.

- 91 The MESENTERY is formed by two layers of the Peritoneum, which separate at the loose or folded edge, to surround the Intestines.
- 92 That part which supports the small Intestines retains the

Anws.

- name of Mesentery, that which fixes the large Intestines is called Meso-colon.
- 93 The MESENTERY begins at the last incurvation of the Duodenum;
- 94 It passes obliquely from left to right along the Vertebræ of the Loins.
- 95 It is narrow at its upper and lower parts, but chiefly at the upper, while the middle portion is very broad, and its intestinal edge much plaited.
- 96 Its Laminæ are connected together by cellular substance.
- 97 Numerous Lymphatics, Arteries, Veins, Nerves, and Glands, are contained between these Laminæ.
- 98 The Meso-colon is a continuation of the Mesentery to support the large Intestines;
- 99 It begins at the Extremity of the Ilium.
- 100 The Ligamentum Coli Dextrum is situated at the commencement of the Meso-colon, under the right Kidney;
- 101 It is formed by a small transverse fold of the Mesentery?
- Kidney, where it almost disappears by the adhesion of the Colon to that Kidney, and to the first turn of the Duodenum; appearing again, it increases in breadth, and passes transversely under the Liver, Stomach, and Spleen, including the great arch of the Colon; it then turns downward toward the left Kidney.

Anws.

- 103 Below the left Kidney it is again short, forming what is called, the Ligamentum Coli Sinistrum.
- on the left Psoas, and continues the Sigmoid Flexure of the Colon.
- 105 Between the Rectum and Os Sacrum, at the upper part it fixes this gut, and is called Meso-Rectum.

LIVER.

- 108 The Liver is the largest Viscus in the Abdomen; it is a solid mass of a dark red colour, inclined to a brownish yellow, whose office it is to secret the Bile.
- in the right Hypochondrium, which it nearly fills; and partly in the Epigastrium, between the Spine and Ensiform Cartilage, terminating generally in the left Hypochondrium.
- 108 Its Figure is irregular, being convex superiorly, unequally concave inferiorly; very thick toward the back and right sides; it becomes gradually thin towards the left side, and forms an acute edge anteriorly.
- 109 It is divided into three Lobes, viz. the great or right Lobe, the small or left Lobe, and the Lobulus Spigelii.
- 110 The right Loke is divided from the left superiorly by a membranous Ligament, and inferiorly by a considerable Scissure.
- 111 The Lobulus Spigelii is situated on the inferior side of

Answ.

the Liver toward its back part, near the great Fissure.

- 112 Seven Depressions, or Fissures, are noticed on the under side of the LIVER, viz.
- of the Vena Portæ; thirdly, one for the Sinus of the Vena Portæ; thirdly, one for the Vena Cavæ; fourthly, a Furrow between the left Lobe and Lobulus Spigelii, for a Venal Canal in the Fœtus; fifthly, a Depression for the Gall-bladder; sixthly, a superficial Cavity, caused by the Stomach; and seventhly, the great Sinus, for the Spine and Œsophagus, at the posterior part of the left Lobe.
- 114 The Great Fissure runs from behind forward, on the inferior side of the Liver, between its two Lobes.
- 115 The Sinus of the Vena Portæ is placed transversely between the eminences on the inferior Surface of the great Lobe.
- 116 The Sinus of the Vena Cava is situated posteriorly at the Extremity of the great Fissure, between the great Lobe and Lobulous Spigelii.
- 117 The Depression for the Gall-bladder is situated on the forepart of the inferior Surface of the great Lobe.
- 118 The LIVER is kept in its place by five Ligaments, viz.
- 119 The broad Ligament, the round Ligament, the right and left lateral Ligaments, and the Coronary Ligament.
- 120 The broad, and the right and left Ligaments, are continuations, or duplicatures, of the Peritoneum; the round Ligament was the Umbilical Vein of the For-

Answ.

- tus, and the Coronary Ligament is merely a broad adhesion.
- The broad Ligament; or Ligamentum Latum, divides the right Lobe from the left, and connects the Liver to the Diaphragm, and to the upper and inner part of the Sheath of the Rectus Abdominis obliquely, so as to be nearer the Linea Alba, below than above.
- The round Ligament, on Ligamentum Rotundum, the remains of the Umbilical Vein of the Fætus, is placed in the anterior edge of the broad Ligament, it is fixed to the Umbilicus, and enters the great Fissure.
- 333 The lateral Ligaments connect it to the Cartilages of the false Ribs.
- 194 The Coronary Ligament connects the Liver to the right-Ala of the Tendinous portion of the Diaphragm.
- which by their intertexture form numerous friable.

 Corpuscles.
- Membrane, called, the Capsule of the Vena Portæ, or Glisson's Capsule.
- 7.27 The Vessels of the Liver are the Hepatic Artery, the Vena Portæ, and the Hepatic Veins; to which may be added, the Excretory Ducts, and Absorbents.
- 328 The Hepatic Artery and Vena Portæ, both carry blood to the Liver.
- 129 The Hepatic Artery is the Nutrient Artery of the Liver.
- No The Vena Portæ acts both as a Vein and an Artery; as a Vein it receives the blood from most of the Abdo.

Answ.

minal Viscera; as an Artery it ramifies through the Liver, and there secrets the Bile.

- 131 It gives off five principal branches.
- The terminations of its branches are in Villous Folliculi, or Acini, as they have been called.
- 183 In these Folliculi, or Acini, the Bile is secreted.
- 134 From them the excretory ducts commence, and are called Pori Biliarii.
- 135 These ultimately terminate in one large duct, called the Ductus Hypaticus, which
- 135 After joining the duct from the Gall-bladder, called, the Cystic Duct, terminates in the Duodenum.
- 137 The Hepatic Veins return the blood to the inferior Cava.
- 138 The Liver receives its Nerves from the Great Sympathetic and Eighth Pair.
- Portæ, are previously collected together and surrounded by a peritoneal Covering, which is the true Glisson's Capsule.

GALL-BLADDER.

- 240 The Gall-bladder is a small bag which contains the Bile.
- 141 It is situated in the anterior part of the inferior Surface of the great Lobe of the Liver.
- 142 It is Pyriform; but in Infants often Cylindrical.
- 143 It is divided into a Fundus, Body and Neck.
- 144 It lies in a plain, slightly inclined from behind forward

Answ.

in the erect posture; its Fundus being turned forward.

145 It consists of four Coats:

rous minute folds, arranged in a beautiful reticular form, filled with small Lacunæ, or ducts of Follicles, especially near the Neck; at which place the folds become longitudinal, and form a kind of small Pylorus.

147 The Gall-bladder is connected by vessels and cellular membrane to the Liver; but in the Human Body no branches from the Pori Biliarii have been discovered

opening into it.

148 Its Neck is formed by the contraction and incurvation of the small Extremity;

149 On its internal Surface there are several Reticular Rugæ.

150 From the Neck proceeds a duct called the Ductus Cysticus, which, after running near the Hepatic Duct, joins it.

151 From their union proceeds the Ductus Communis Cho-

ledochus;

152 This Duct terminates, in common with the Pancreatic Duct, on the inside of the Duodenum.

Portæ in the Acini, passes through the Pori Biliarii and branches of the Hepatic Duct; by this Duct it is conveyed to the Ductus Communis Choledochus; from whence, in part, it passes, by the Cystic Duct to the Gall-bladder;—when needed in the Intestine,

Answ.

it returns by the Cystic Duct, and mixes, in the Ductus Communis Choledochus, with fresh Bile from the Hepatic Duct; and lastly passes into the Duodenum.

PANCREAS.

- 154 The Pancreas is a long, flat, glandular Body, of a greyish white colour.
- transversely under the Stomach, and before the Spine, the Crura of the Diaphragm, the Aorta, and Vena Cava.
- anterior and a posterior Side; a large and a small Extremity.
- 157 Its large or right Extremity is connected to the second Incurvation of the Duodenum; and its lesser Extremity to the Omenturn, near the Spleen.
- where it is connected with the Duodenum, this gland sends a process downward, called the lesser Pancreas;
- greater Pancreas, although sometimes it has a separate opening into the Duodenum.
- 160 The Pancreatic Duct is nearly transparent, it arises from numerous small branches.
- 261 It is placed horizontally within the substance of the gland, toward the middle of its inferior Edge.

Anws.

- 162 It terminates, along with the Ductus Choledochus, in the Duodenum.
- 163 The Pancreas consists of a great number of small glandular Particles connected loosely together; it resembles the Salivary Glands.
- 164 The Arteries of the Pancreas are derived from the Pyloric and Duodenal, but chiefly from the Splenic Artery.
- 165 Its Veins pass to the Splenic Vein.
- 166 Its Nerves are derived from the Great Sympathetic and Eighth Pair.

SPLEEN.

- 167 The Spleen is a soft, spunge-like, fleshy, purple mass.
- 168 It is placed in the left Hypochondrium, at the large Extremity of the Stomach.
- 169 It is somewhat of an eval form.
- 170 It has an External Surface, uniformly convex; an Internal Surface, divided by a groove into two Concavities; (the anterior opposed to the Stomach, the posterior to the Colon and left Kidney;) two Edges, often notched; and two Extremities.
- 171 It appears of cellular structure; but is probably a congeries of blood Vessels.
- 172 It receives its blood from the Splenic Artery, a branch of the Cæliac.
- 173 Its Veins pass to the Vena Portæ.

Answ.

- 174 Its Nerves are derived from the Great Sympathetic and Eighth Pair.
- 175 Its use has been a matter of contention: it most probably contributes towards the process of Assimilation, first, by its capacity to receive various quantities of blood; and secondly, by effecting some change on it.

OMENTUM.

- 176 The OMENTUM, or Epiploon, is a very large Duplicature of the Peritoneum;
- 177 It hangs loosely before the small Intestines.
- 178 It resembles a kind of flat bag, whose sides are in contact.
- 179 Its Mouth, or opening, is attached to the great Curvation of the Stomach, and to the Arch of the Colon, and may be separated by inflation.
- stance, between which there are numerous portions of fat.
- OMENTUM, which is fixed to the small Curvature of the Stomach, and to the concave side of the Liver.
- Abdomen, on the right side only under Glisson's Capsular, by a semilunar Orifice, called, the Foramen of Winslow.

KIDNEYS.

Answ.

- 183 The Kidneys are two glandular Bodies, of a red colour, destined to secrete the Urine.
- They are situated in the posterior part of the Abdomen, on each side of the Lumbar Vertebræ; between the last false Ribs and Ossa Ilia.
- 185 The right Kidney lying under the great lobe of the Liver, is lower than the left, which lies under the Spleen.
- Bean: its circumference is convex on the outer side, and concave on the inner; the posterior side is broader and flatter than the fore side, and the upper Extremity is more incurvated, and larger than the lower.
- where surrounded by a Proper Coat; which consists of two Laminæ: of which the external is thin and adheres to the internal; this penetrates the substance of the Kidney every where by numerous elongations.
- 188 The Kidney consists of two substances, namely, an External, termed Cortical Substance, and an Internal, named Medullary Substance.
- and more dense Texture than the Cortical; it is divided into a number of unequal conical portions;

Answ.

which terminate in nipple-like projections, called, Papillæ, or Mamillary Processes.

- 190 The number of Papillæ varies from eight to twelve, or more.
- 191 Each Papilla is situated in a small funnel-like Cavity, called, Calix, or Infundibulum.
- The Infundibula join and form two or three tubes which ultimately form a large conical Cavity, called, the Pelvis of the Kidney; it is placed in part within, but more without the Body of the Kidney, and is the commencement of the Duct of the Kidney, called,
- 193 The Ureter;
- 194 It descends, obliquely and slightly inflected, from the Kidney to the sides of the anterior part of the Os Sacrum; and, passing between the Rectum and Bladner, terminates in the last of these Viscera.
- 195 Three Coats compose the Ureter.
- 196 The external consists of a compact filamentary substance; the middle one of several Strata, or Fibres; and the internal one is of the mucous kind.
- 197 The Artery of the Kidney is called, the Emulgent, and comes directly from the Aorta.
- 198 The Vein of the same name goes to the inferior Cava.
- 199 The Nerves are chiefly from the Great Sympathetic and Eighth Pair.
- 200 The Emulgent Artery and Vein, and the Ureter enter the Kidney at its inner Edge—the Artery being the uppermost—the Pelvis, and beginning of the Ureter, behind and below the blood vessels.

RENAL GLANDS.

ARSW.

- 201 The Renal Glands are two small, flat, dark yellow-coloured bodies; situated
- 202 Immediately above the Kidneys, on which they rest.
- 208 Each Gland is of an oblong, irregular, three-sided Figure.
- 204 A Cavity is frequently found within;
 - 205 Of a narrow and triangular figure;
 - £06 It is full of short, strong, yellow Villi, and a dark bile-like fluid.
 - 207 They are much larger in the Fætus than in the adult.

SECTION XXIX.

OF THE PELVIC VISCERA.

I Under this head are comprised the Urinary Bladder, Rectum, and parts of Generation.

URINARY BLADDER.

The Urinary Bladder is a large membranous Bag, which serves as a reservoir for the Urine.

placed in the lower part of the Abdomen, and front the Pelvis, immediately behind the Symphisic Pubis, above and before the lower part of the Rectum. is somewhat oviform; rounder above than below when empty; and broader below than above when full.

Anws.

- 5 It is divided into a Body, a Neck turned downward and forward, and a Fundus turned upward.
- 6 It has four Coats, viz.
- 7. An external, or Peritoneal; a second, or Muscular; a third Cellular, commonly called Nerves; and a fourth Villous, or Mucous Coat.
- 3 The Peritoneal Coat covers only the Fundus, sides and back part, to within a little of the termination of the Ureters.
- The Fibres of the Muscular Coat are collected into distinct bundles; the external ones are mostly longitudinal; the middle ones are inclined to each side, and the internal ones become more and more oblique; thus crossing each other in various directions.
- structure and use the Tunic, of the same name in the Stomach and Intestines.
- 11 The Internal, Mucous, or Villous Coat, though not thick, is of firm texture; it is thrown into folds, or Rugæ, when the Bladder is empty.
- 12 There are three Openings into the Bladder, situated at the under part.
- 13 One inferior, which is the beginning of the Urethra, surrounded by the Neck of the Bladder;
- 14 Which is an elonganoo of the proper coats of the Bladder, terminating in the inferior Orifice.
- \$5. Two posterior openings, which are the terminations of the Ureters,

Answ.

- open an inch and a half from each other, and from the Urethra.
- 17 At the top of the Bladder, above the Symphysis Pubis there is a ligamentary Rope, which ascends between the Periteneum and the Linea Alba to the Umbilicus, called, the Urachus.
- 18 In the Fœtus it is hollow, but in the human subject its use is not understood.
- 19 The internal Iliac Arteries send branches to the Bladder.
- 20 Its Veins pass to the internal Iliac Veins.
 - 21 Its Nerves come from the sacral and great Sympathet? Nerves.

MALE ORGANS OF GENERATION.

the Testicles, with the Epididymis, and Vasa Deferentia, contained in the Scrotum; the Vesiculæ Seminales, Prostate Gland, Cowper's Glands, and Veru-Montanum, about the neck of the Bladder; and lastly, the Penis, composed of the Corpora Cavernosa, Coppus Spongiosum, Glans Penis, and Urethra.

SCROTUM.

23 The Scrotum is a loose Bag, formed merely by a continuation of the Integuments, devoid of fat.

Answ.

- 24 A projecting line, called, the Raphe, divides it into two equal parts.
- 25 The Cellular Substance on the inside of the Scrotum, is fibrous, and of a red colour, it has therefore by some, been thought muscular, and called *Dartos*.
- 26 Loose Cellular Substance every where connects the Testicles to the Scrotum, and forms a Septum between them.

TESTES.

- 26* The Testicles are two glandular bodies of an ova figure, which secrete the Semon, and are contained in the Scrotum.
- 27 Each Testicle has two Coats, viz. the Tunica Vaginalis, and the Tunica Albuginea.
- 28 The Tunica Vaginalis surrounds the Testicle as the Pericardium does the Heart—adhering only at its posterior and superior part—its internal surface is lubricated, by a serous fluid.
- 29 The Tunica Allugined firmly invests the Testicle; and gives it form and support.
- seen to consist of an immense number of whitish tubes, called, *Tubuli Seminiferi*, folded in various ways, and distributed in different Fasciculi, between membranous Septa; the Septa are disposed longitudinally, diverging from the posterior edge of the Testicle from a white body, which may be termed the

Answ.

Nucleus of the Testis. At this Nucleus the Tubuli Seminiferi terminate in common trunks, forming the Rete Testes; which afterwards penetrate the upper part of the anterior extremity of the Testes, and are called, the Vasa Efferentia.

EPIDIDYMIS.

- along the lateral external part of the upper edge of the Testicle, as far as its posterior Extremity, from the common Trunks of the Tubuli Seminiferi, or Vasa Efferentia;
- 3. It in some measure resembles a flat arch, slightly concave on the under side, and irregularly convex on the upper side.
- Testicle, and receives the Vasa Efferentia; its posterior Extremity, or Cauda, which also adheres, he comes gradually smaller; the whole appears composed of one convoluted tube, which
- 34 Terminates in the excretory duct of the Testicle, called, the Vas Deferens.

VAS DEFERENS.

- 35 The Vas Deferens or Excretory Duct of the Testicle, is a small white Tube of dense structure.
- **36** It arises from the Epididymis.

Ansir.

of the Testicle, the Spermatic Cord, in the Cellular Substance, of which it ascends to the Abdominal Ring, being situated behind the vessels; having reached the Peritoneum, it separates from the vessels and runs back, in a curved direction, through the Cellular Substance of the Peritoneum; descends to the nearest side of the Bladder, then passes behind it, covered by its Pentoneal Coat; it afterwards continues its course toward the Neck of the Bladder, where it terminates near its fellow. In this course it crosses the Umbilical Artery and the Extremity of the Ureter, passing behind the former, and between the latter and the Bladder.

VESICULÆ SEMINALES.

- 38 The Vesicula Seminales are two small oblong, membranous Reservoirs,
- Bladder, and before the Rectum; near each other anteriorly, but distant behind.
- 40 They are formed by a Convolution of one Tule, whose doublings are closely connected together, so that
- 41 Internally they appear composed of Cells.
- 42 Externally they are covered and connected to the Bladder and other surrounding parts, by cellular membrane.
- 43 The Internal Coat is a Villous Secreting Membrane.

Answ.

- 44 The Vasa Deferentia, becoming larger, run between the contiguous Extremities of the Vesiculæ Seminales, and the termination of each is partly formed by the contiguous Vesicula, so that these Extremities communicate on each side.
- 45 Each Vesicle, after joining the contiguous Vas Deferens, pierces the Prostate Gland, and opens into the Urethra.
- 46 The Vesiculæ secrete a peculiar fluid, but are not thought to retain the Seed.

PROSTATE GLAND.

- 47 The Prostate Gland is a firm glandular body,
- 48 Situated at the neck of the Bladder and beginning of the Urethra.
- 49 Somewhat of the form, and about the size of a Chesnut; broad behind, pointed before.
- 50 Its basis is turned toward the Bladder, its Apex toward the Urethra; its inferior Surface is convex and connected with the Rectum; through its substance, near the superior Surface, the Urethra passes.
- 1 It is of a spongy, but very compact texture, consisting of numerous Follicles.
 - 52 Their ducts, ten or twelve in number, open into the Ure-
 - 53 It secretes a peculiar thin white fluid, which mingles with

ANTIPROSTATÆ.

Answ.

- 54 The Antiprostate, or Couper's Glands, are two bodies of the size of a pea.
- 55 Situated before the Prostate, near the bulb of the Urethra.
- Their ducts open near the beginning of the Urethra.
- 157 They contribute a fluid which lubricates the Urethra.

VERU-MONTANUM.

- 58 The Veru-Montanum, or Caput Galinaginis, is a small oblong oval eminence,
- Situated immediately within the Prostate, at the under part of the Urethra.
- 60 Its summit is pierced by the two Orifices of the Vesiculæ Seminales.

PENIS.

The Penis consists of the Corpora Cavernosa, Corpus Spongiosum, Urethra, and Glans Penis.

CORPORA CAVERNOSA.

- The Corpora Cavernosa form the body of the Penis, they are two large ligamentary Tubes firmly united together,
- \$3 Situated by the side of each other.
- Their junction is marked by two Grooves, of which one is superior, the other inferior and much the largest.

Answ.

- 65 The Corpus Spongiosum Urethræ is lodged in the lower Groove.
- 66 The Vena Magna Penis is placed in the upper Groove.
- 67 They terminate, anteriorly, by a rounded Extremity, which is covered by the Glans Penis.
- 67* Posteriorly they are entirely separate, forming the Crura Penis which are attached to the edge of the Ramus of the Os Ischium and Os Pubis.
- 68 A dense ligamentous sheet forms their external part; internally they consist of numerous cells, which freely communicate with each other.
- They are internally separated from each other by a particular Septum, called *Pecten*, which however is perforated by numerous Fissures.

URETHRA.

- 70 The URETHRA is a long membranous Canal, extending from the neck of the Bladder to the end of the Penis.
- 1 It is lodged in the lower groove, between the two Corpora
- 72 It is not throughout of equal bore, being most dilated in the Prostate Gland, again an inch and a half before it, and lastly just before its external Orifice.
- 73 It is a continuation of the Membrane which lines the Bladder.
- 74 It has numerous small openings on its surface leading to minute pouches, called Lacuna.
- 75 Their openings are turned forward.

CORPUS SPONGIOSUM.

Answ.

- 76 The Urethra is surrounded by a substance called, the Corpus Spongiosum Urethra, except at about a finger breadth and a half from its origin at the neck of the Bladder, this is called,
- 77 The membranous part of the Urethra, which is about an inch of its length before the Prostate.
- 78 The posterior commencement of the Corpus Spongiosum, is dilated into a conical prominence, called, the *Bulb*.
- 79 Anteriorly it expands over the ends of the Corpora Cavernosa, and forms the Glans Penis.
- 20 The GLANS PENIS is perforated anteriorly by the Orifice , of the Urethra;
- It is terminated posteriorly by a prominent edge, called, Corona Glandis.
- The Corpus Spongiosum, (forming the Bulb behind and the Glans before,) is composed of a Congeries of Veins.
- 33 The Arteries of the Penis come from the internal Pudendal; these pour their Blood into the cavernous bodies.
- Cavernosa, they then form the Corpus Spongiosum, which is an extensive plexus of Veins, from this several branches pass to the Doisum Penis, and join the Vena Magna Penis; this passes under the arch of the Pubis, where it opens into another considerable plexus which surrounds the Prostate and neck of the Bladder, and finally the Hypogastric Veins receive the

Answ.

\$5 This mechanism explains Erection: the Arteries, acting with increased velosity, distend the Corpora Cavernosa with Blood, where it is retained, on account of the peculiar construction of the Veins, through whose plexus it flows slowly.

INTEGUMENTS OF THE PENIS.

- and very moveable covering to the *Penis*, except on the Glans, where they are very firmly adhering, and of much more delicate structure.
- form a loose doubling, called, the Præputium, which, in the uncrected state, covers the Glans.
- ■8 A fold of the Præputium at the under part of the Glans, is called, Frænum.

FEMALE ORGANS OF GENERATION.

- *9 The Female Organs of Generation are divided into external and internal parts.
- The internal parts are the Uterus, and its appendages, viz. the Fallopian Tubes, Ovaria, Spermatic Vessels, Ligamenta Lata, Ligamenta Rotunda, and the Vagina.
- Nymphæ, the Clytoris, the Orifice of the Urethra, and the Orifice of the Vaging.

INTERNAL PARTS.

UTERUS.

Answ.

- 92 The Uterus, or Womb, is a hollow, fleshy viscus, destined to retain and nourish the Fœtus.
- 33 It is placed between the Bladder and Rectum.
- 94 It is somewhat of the figure of a flat flask, about three fingers breadth in length, one in thickness, two in breadth at one end, and scarcely one at the other.
- 95 It is divided into its Fundus, or upper part; Body, or middle; Cervix or Neck, which is turned down-ward.
- The Cavity of the Uterus is small, owing to the great thickness of its sides; it is flat and resembles an oblong triangle, the shortest side of which corresponds to the Fundus, and two longest sides toward each hand; while all of them bend inward to the cavity which they form.
- 97 There are three Openings into the Cavity of the Uterus, two at the angles of its Fundus, and one at its Neck.
- Those at the Fundus lead to the Fallopian Tubes,
- 99 They with difficulty admit a bristle.
- 100 The Opening at the Cervix leads to the Vagina,
- 101 It is wider than those at the Fundus, and of a flat form,
- 102 It is called, the Internal Orifice of the UTERUS, Os Uteri, or Os Tineæ.
- 203 A very fine Membrane lines the Cavity of the UTERUS.

Answ.

- 104 In the Neck, which leads to the Os Tincæ, the internal Membrane forms Rugæ.
- 105 The Openings of many Follicles are to be seen about the the Os Uteri.
- 105 The Uterus is of a spongy, yet compact structure, with an intertexture of numerous vessels.
- 107 It is covered externally by a portion of the Peritoneum continued from that which covers the Bladder and Rectum.
- 108 The Laminæ of the portions of Feritoneum, which covers the Uterus meeting on each side, form two duplicatures, called, the *Broad Ligaments*, or Ligamentary Lata,
- 109 They pass from the edges of the Uterus to the sides of the Cavity of the Pelvis, thus transversely dividing it into two, an anterior and a posterior Cavity.
- 110 The two fold superior edges of the Ligamenta Lata are called Alæ, or Pinions.
- 111 Between the Laminæ of the Ligamenta Lata are contained the Fallopian Tubes, the Ovaria, some of the Spermatic Vessels, those of the Uterus, the round Ligaments, and Nerves.
- long cords, which arise from the superior part of the sides of the Uterus; they pass between the Laminæ of the Ligamenta Lata, and then forward toward the Abdominal Ring, through which they pass to the Pubis, where they are fixed.

OVARIA.

Answ.

- The Ovaria are two oval, oblong, flat bodies, in which the rudiments of the Fœtus are supposed to be formed.
- 114 They are *situated* in the duplicature, called, the Posterior Pinion of the Ligamenta Lata, near the Fundus of the Uterus.
- In addition to the Broad Ligaments, two short round Ligaments attach them to the Uterus.
- several small transparent vesicles, called Ova, which contain a glary fluid.

FALLOPIAN TUBES.

- The Fallopian Tupes are two small worm-like Tubes, which receive the Rudiments of the Fœtus from the Ovaria, and convey them to the Womb.
- 118 They proceed from the angles at the Fundus Uteri, towards the lateral parts of the Pelvis; being included in the anterior Pinions of the Ligamenta Lata.
- opening into the Uterus, but they become gradually larger towards the opposite Extremities.
- are irregularly round, and expand in the form of a membranous fringe, called, the Fimbriæ;
- 121 These Extremities are directed towards the Ovaria.
- 192 They are loose and unconnected, except, when under the

Answ.

- influence of impregnation, they expand and embrace the Ovaria.
- 123 These Tubes are lined with a fine membrane, which is thrown into longitudinal folds.
- 124 Their structure seems to be spongy, somewhat resembling that of the Uterus.

VAGINA.

- 125 The VAGINA is a large fleshy Tube, extending from the Cervix Uteri to the external parts.
- 126 It is situated behind and below the Bladder and Urethra, before and above the termination of the Rectum.
- 127 Into its upper part the Os Uteri projects.
- 128 It is fixed to the neck of the Uterus.
- 129 Anteriorly it is firmly united to the Urethra, and a more loose cellular membrane connects it with the Bladder.
- 130 Posteriorly, at the lower part it is connected by cellular Substance, to the Rectum.
- 131 It is covered by Peritoneum at its upper and posterior part.
- by a mucous membrane, which is thrown into numerous Ruga.

ARTERIES, VEINS, AND NERVES OF THE UTERUS, &c.

Answ.

- 133 The Uterus is supplied by the Hypogastric Arteries, and the Ovaria by the Spermatic Arteries.
- 134 'The Veins correspond in name and distribution with the Arteries.
- 135 They receive their Nerves from the Lumbar Sacral and Sympathetic Nerves.

EXTERNAL PARTS.

PUBIS.

- 136 The External Parts taken together are called, the Pudendum, or Vulva.
- 137 The Pubis, or Mons Veneris, is that broad eminence at the lower part of the Hypogastrium, between the two groins, which, at the age of puberty, is covered with hair.
- 138 Its hairy Integuments are made prominent by a particular thickness of the Adopose Membrane covering the forepart of the Ossa Pubis.

LABIA PUDENDI.

139 The Labia Pudendi reach from the middle of the lower part of the Pubis to within an inch of the Anus.

Answ.

- 740 The points at which they meet are called, the Commissures,
- 141 They are formed by a large longitudinal fold of Integuments containing cellular substance and fat: externally they are covered with hair; but the sides, which are turned towards each other, are smooth and lubricated.
- 142 The space situated between the inferior Commissure of the Labia and the Anus, is called, *Perineum*,
- 143 It measures about a large finger's breadth.
- two longitudinal folds, called, the Nymphæ; at the angle formed superiorly by their junction a small fleshy body, called, Clitoris; under this the opening of the Urethra; more inferiorly the opening of the Vagina; between which and the inferior Commissure a depression, called, Fossa Navicularis.

NYMPHÆ.

- 145 The Nympum are two folds of the inner skin of the Libia,
- 1.46 Situated internal to the Labia, and taking nearly the same direction.
- they descend, and contract at their lower Extremity.
- 148 They consist of a spongy, cuticular substance, intermixed with Follicles.

Answ.

149 Their lower Extremities are distant from each other, their upper unite around the Clitoris.

CLITORIS.

- 150 The CLITORIS is an oblong, firm, projecting body,
- 151 Situated immediately under the superior Commissure of the Labia.
- 152 ADuplicature of the internal Membrane, called its Præputium, surrounds it at the beginning of the Nymphæ.
- united together, anteriorly forming the Glans, and divided posteriorly into two Crura.
- 154 The Crura are attached to the Rami of the Ossa Pubis.
- 155 It is capable of erection, which is effected in the same manner as in the Penis, and it is supposed to be the chief seat of sensation in coition.

-URETHRA.

- 156 The URETHRA is situated between the Nymphæ, and below the Clytoris, just above the Vagina.
- 157 The Orifice is slightly prominent and wrinkled.
- 158 On the edges of its Orifice several Lacuna are situated, and others internally.
- 159 It is a membranous Tube of the same structure as in Males.
- 160 The Female Urethra is not more than an inch in length, but it is wide; it has no prostate Gland.

Sect. XXX. ORGANS OF THE SENSES.

THE ORIFICE OF THE VAGINA.

Answ.

- 161 The Orifice of the Vagina is placed immediately below the Urethra, and above the Fossa Navicularis.
- 162 It is narrower than the rest of the Vagina.
- 163 At its under part a delicate membrane is situated, called, the Hymen.

HYMEN.

- 164 The Hymen is a delicate membranous fold, of a semilunar form, whose cornua are turned upwards.
- 165 It does not completely close the Vaginal Orifice being defective towards the Urethra.
- 166 When form in coitu, or otherwise, the remains form little small fleshy eminences, called, Carunculæ Myrtiformes.
- The use of the *Hymen* is not evident; it is not, as has been supposed, a test of virginity.

OF THE ORGANS OF THE SENSES.

- The Organs of the Senses are parts constructed to receive impressions from all external objects.
- 2 They are five in number, viz. first, for the Sense of Sight, the Eyes; secondly, for the Sense of Smell, the Nose; thirdly, for the Sense of Hearing, the Ears;

Answ.

fourthly, for the Sense of Taste, the Mouth and Tongue; fifthly, for the Sense of Feeling, the Skin.

SECTION XXX.

ORGAN OF VISION.

- 1 The Organ of Vision is two-fold, there being two Eyes,
- 2 Situated in the Orbits, surrounded by Muscles, which move them, and an apparatus for tears; these parts are called, the Appendages of the Eye.

"ORBITS.

- 3 The Orbits are two conical, or funnel-like Cavities,
- 4 Situated on each side of the Nose, just below the forehead; their bases are turned forward, and obliquely outward.
- 5 Each Orbit is composed of parts of seven Bones, viz.
- 6 The Os Frontis, Os Sphænoides, Os Ethmoides, Os Maxillare Superius, Os Malæ, Os Lacrymale, and Os Palati.
- 7 The Os Frontis, Os Maxillare Superius, and Os Malæ, form the basis or ridge of the Orbit.
- * The Os Sphenoides, and Os Palati, form its Apex.
- 9 The Os Frontis above, the Superior Maxillary Bone, and Os Malæ, below the Os Lacrymale and Os Ethmoides towards the Nose; and the Os Sphænoides

Sect. XXX.

ORGAN' OF VISION.

Answ.

towards the Temple, complete its sides.

- 10 Three great Foramina are noticed in the Orbit, namely, the Foramen Opticum, the Fissura Sphanoidalis, and the Fissura Spheno-Maxillaris.
- 11 The Foramen Opticum is a large round hole at the Apex.
- The Spanoidal Fissure, or Foramen Lacerum Orbitale Superius, is situated at the upper part of its external side.
- The Sphæno-Maxillary Fissure, or Foramen Lacerum Orbitale Inferius, is situated at the lower part of its external side.
- 14 Its lining is derived from the Dura Mater, and Periosteum of the Face.

LACHRYMAL AND EXTERNAL PARTS OF THE EYE.

SUPERCILIA.

- of The Supercitia, or Eyebrows, are situated upon the superciliary ridge of the Frontal Bone.
- 16 They consist of two arches of hairs, placed upon an additional Portion of the Adipose Membrane.
- 17 They are moved by the Occipito Frontalis, and Corrugator Supercilii.

PALPEBRÆ.

The Palpebra, or Eyelids, are placed transversely above and below the anterior Portion of the globe of the Eye.

Sect. XXX.

ORGAN OF VISION.

Answ.

- 19 The superior is the largest and most moveable.
- 20 Their Extremities meet, forming an outer and an inner Canthus, or angle;
- 21 That towards the Nose is the largest.
- 22 They consist of common Integuments; of the Orbicularis

 Palpebrarum; of the Cartilages called Tarsi, which

 contain the Ciliary Glands; and of the Cilia, or Eye
 lashes.

TARSI.

- 23 The TARSI are thin Cartilages,
- 24 Situated at the Edge, and in the substance of each Eyelid.
- 25 They are broader in the middle than at their Extremities; the Tarsus of the upper Eyelid is the largest.
- 26 Their Ciliary Edges, which are turned toward each other, are the thickest.
- 27 These edges are so formed, that when they meet, a small groove is made betwixt them and the Eye-ball, which conduct the tears to the inner Canthus.
- 28 The internal Surfaces of the Tarsi are grooved for the reception of the Ciliary Glands.

CILIARY GLANDS.

29 The CILIARY GLANDS, or Glandulæ Meibomianæ, secrete an unctious matter, which lumbricates the edges of the Eyelids.

Vol. II.

Answ

- 30 They are situated on the innerside of the Tarsi.
- They appear like numerous white lines, taking a tortuous course to the edge of the Eyelids, where the openings of their ducts may be seen.

CILIA.

- 32 The CILIA, or Eyelashes, are rows of pencil-like hairs.
- 33 Situated on the edges of the Eyelids.
- 24 They diverge; those of the upper Eyelid turn gradually upward; and those of the lower, which are shorter, take the opposite course.
- 35 The middle hairs are longest; they diminish in size towards the corners.

LACHRYMAL APPARATUS.

Gland, which secretes, and of the parts which convey away the tears, viz. the Caruncula Lachrymalis, Plicor Semilunaris, Puncta Lachrymalia, Canaliculi Lachrymales, Lachrymal Sac, and Ductus ad Nasem.

LACHRYMAL GLAND.

hind and somewhat above the external angular pro-

Answ.

- es It is somewhat flatted and divided into two lobes, the greater of which is the most external.
- 39 It has several excretory ducts, which descend almost parallel to each other, through the substance of the membrane which lines the upper Eyelid, and pierce it near the superior edge of the Tarsus.

CARUNCULA LACHRYMALIS.

- 40 The CARUNCULA LACHRYMALIS is a little red eminence.
- 41 Situated between the internal angle of the Eyelids and the ball of the Eye.
- 42 It seems to be of glandular structure.
- 48 It secretes a yellowish oily matter, with which the hairs on its surface being besmeared, detain any small bodies that float in the tears; it also directs and assists the tears in their course.
- 44 The depression betwixt this, the Eyelids and Eyeball, has been called, Lacus Lachrymalis;
- 45 Here the tears collect to pass into the Puncta Lachrymalia.

PLICA SEMI-LUNARIS.

- 46 The PLICA SEMI-LUNARIS is situated between the Caruncula Lachrymalis and the Ball of the Eye.
- 47 It resembles the figure of a crescent.
- 48 Its Cornua are turned toward the Puncta Lachrymalia.
- 49 Its serves to direct the tears toward the Puncta.

Sect. XXX.

ORGAN OF VISION.

PUNCTA LACHRYMALIA.

Answ.

- 50 The Puncta Lachrymalia are two small orifices,
- 51 Situated one on the edge of each Eyelid, very near the inner angles, opposite to the Cornua of the Plica Semi-Lunaris, and precisely opposite to each other.
- 52 A minute cartilaginous circle surrounds them, and a fine membrane lines their orifices.
- 53 Their outer edges touch each other when the Eyelids close.
- 54 They suck up the tears and convey them to the Lachrymal ducts.

CANALICULI LACHRYMALES.

- 55 The Canaliculi Lachrymales, or Lachrymal Ducts, are two minute Canals,
- 56 Situated between the Puncta Lachrymalia and the Lachrymal Sac.
- 57 The superior first ascends, then gradually descends; the inferior first descends, then gradually ascends; they then meet and form a common tube, which opens into the Lachrymal Sac.

LACHRYMAL SAC.

59 The LACHRYMAL SAC is situated immediately below the inner Canthus of the orbit in a lony Groove, or fossa, on the side of the upper part of the Nose.

Answ

- This Groove is formed by the Nasal process of the superior Maxillary and Lachrymal Bones superiorly, and by the Os Maxillare, lower part of the Os Lachrymale, and upper portion of the inferior turbinated bone inferiorly.
- 60 The Sac is an oblong membranous bag.
- 61 About one fourth of its length is above the tendon of the Orbicularis Palpebrarum, and the rest below it.
- 62 The Lachrymal Ducts open into it immediately behind the tendon of the Orbicularis.
- 63 The Ductus ad Nasem proceeds from its lower part.

DUCTUS AD NASEM.

- 64 The Ductus AD NASEM descends from the Lachrymal Sac into the Nose, in a bony Groove, which is
- 65 Formed by the inferior part of the Os Lachrymale and superior part of the Inferior Turbinated bone.
- 66 The Duct terminates underneath and behind the anterior extremity of the inferior turbinated bone.
- 67 The Tears, secreted by the Lachrymal Gland, are poured, by its Excretory Ducts over the anterior surface of the Eye; which, in the movements of the Eyelids, they every where moisten; the Puncta Lachrymalia absorb them; they are conveyed, by the Lachrymal Ducts, to the Lachrymal Sac, and through the Ductus ad Nasem, they pass into the Nose.

Sect. XXX.

ORGAN OF VISION.

THE GLOBE OF THE EYE.

Answ.

- 68 The GLOBE OF THE EYE is nearly of a spherical figure.
- 69 Its anterior transparent part projecting somewhat, appears like the section of a lesser sphere.
- 70 It is composed of Membranes, or Coats, filled with Humours, or fluids, which prop its form.

COATS OF THE EYE.

- 71 The COATS OF THE EYE are six in number, namely, the Tunica Conjunctiva, Tunica Sclerotica, Cornea, Tunica Choroides, Iris, and Retina.
- 72 They are divided into partial and more complete Coats, the Conjunctiva, Cornea, and Iris belonging to the former; the Sclerotica, Choroides, and Retina to the latter class.

TUNICA CONJUNCTIVA.

- 73 The Tunica Conjunctiva is a very thin transparent Membrane, which connects the Eyelids to the Globe of the Eye, and may be considered as common to both.
- 74 It covers the anterior part of the ball of the Eye and the inner side of the Eyelids; hence its division
- 75 Into the Conjunctiva Palpebrarum, and the Conjunctiva Oculi.
- 76 It is united to the Globe of the Eye by means of cellular Membrane.
- 77 This union is very firm over the Cornea.

TUNICA SCLEROTICA.

Answ.

78 The Tunica Sclerotica is the most external, and by far the most dense coat of the Eye.

79 It envelops all the ball of the Eye, except the portion anteriorly occupied by the Cornea; and posteriorly it is pierced by the optic Nerve.

80 It is of a firm ligamentous structure.

81 Its posterior part is the thickest.

22 The Muscles which move the Eyeball are attached to this coat toward its anterior part.

TUNICA CORNEA.

The CORNEA is the transparent anterior part of the Globe of the Eye.

84 It is firmly connected to the edge of the Sclerotica, and appears like a watch-glass fixed in the edge of the case.

85 It is circular and more convex than the rest of the ball.

\$6 It is divisible into several Lamellæ, between which transparent fluid is noticed.

TUNICA CHOROIDES.

- 87 The Tunica Choroides is the most vascular Coat of the Eye.
- 88 It is placed immediately within the Sclerotic Coat.
- so It begins at the entrance of the optic Nerve.

Answ.

- 90 It ends near the edge of the Cornea, forming a whitish circle of some firmness, called, the *Ciliary Circle*, and by which it adheres to the Sclerotica.
- 91 It here appears thrown into numerous regular folds, called, Ciliary Processes.
- 92 The internal surface of the Choroid Coat is uniformly covered by a black, or dark brown secretion, called, Nigrum Pigmentum.
- 93 The Ciliary Arteries, after piercing the Sclerotica, ramify copiously in this Membrane; its veins, taking a curious contorted course, are called, Vasa Vorticosa.

IRIS.

- 94 The IRIS is a circular Membrane, with an opening through its centre, forming an imperfect Septum across the Cavity of the Eye.
- 95 Its circumference is attached to the Ciliary Circle.
- 95 The circular aperture at its centre is called, the Pupil, which is lessened or augmented by the movements of the Iris.
- 97 The name of Uven has been given to the posterior part of the Iris, this part is covered with Nigrum Pigmentum.
- 98 It consists of a radiated and a circular layer of muscular fibres; its Arteries, from the Ciliary form, by anastomosis, two circles, one near the circumference, called, Zona Major, the other near the pupil, called, Zona Minner. Its Feins pass to the Vasa Vorticosa of the Choroid.

Sect. XXX.

ORGAN OF VISION

RETINA.

Answ.

- 99 The RETINA is placed internal to the Choroid Coat.
- 100 It arises from the termination of the Optic Nerve of which it is an expansion.
- 101 It extends anteriorly nearly to the Ciliary Circle, terminating upon the edge of the Chrystaline Capsule.
- 102 The Optic Nerwe terminates a little to the inner side of the centre.
- 103 The Forumen of Sommering, and the yellow Zone surrounding it, are parts observable posteriorly, directly at the centre of the Retina.
- 104 It is composed of a pulpy substance of a bluish milky hae;
- 105 Supplied with blood by a small artery, which occupies the centre of the Optic Nerve.

HUMOURS OF THE EYE.

- 106 Three transparent fluids of different densities form the Humours of the Eye.
- 107 They are called, the Aqueous, the Crystalline, and the Vitreous Humours.

AQUEOUS HUMOUR.

- 108 The Aqueous Humour is a perfectly transparent lim-
- 109 Situated behind the Cornea, and before the Crystalline.

Answ.

- 110 This space which it occupies is divided by the Iris into two cavities, called *Chambers*, and which cummunicate through the pupil.
- 111 The anterior Chamber is the largest of the two.
- 112 This humour, while it transmits the rays of light, permits the free motions of the Iris.

VITREOUS HUMOUR.

- 113 The VITREOUS HUMOUR, by much the most bulky humour of the Eye appears of a jelly-like consistence, yet quite transparent.
- 114 It occupies all the ball of the Eye behind the Crystalline Lens, which lies imbeded in its forepart.
- 115 It is spherical, except anteriorly, where it receives the Crystalline Lens.
- Vitrea, or Hyaloidea, of the most delicate and transparent texture.
 - inner surface of its Capsule, into numerous cells, which contain a fluid much resembling the Aqueous Humour.

CRYSTALLINE LENS.

- 118 The CRYSTALLINE HUMOUR, or LENS, is of solid texture.
- 119 It is situated in a concavity at the anterior part of the

Answ.

Vitreous, behind the Aqueous Humour, opposite to the Pupil.

- 120 It resembles a Lens, or magnifying glass, its posterior surface is more convex and larger than the anterior.
- 121 It has a proper Capsule, which adheres firmly to the Capsule of the Vitreous Humour.
- it is of the consistence of softened gum, but is found much firmer towards the centre than externally.

MUSCLES, VESSELS, AND NERVES OF THE EYE.

- 123 Six Muscles move the Eye, they have been already described.
- 124 Its Arteries are derived chiefly from the Ophthalmic, a branch of the internal Carotid.
- Nerves, for besides the Optic, which forms the Retina, the third and fourth pairs, the Ophthalmic, or first branch of the fifth pair, the sixth pair, and twigs from the seventh pair go to the surrounding parts, and form the Ciliary Plexus, whose branches pieces the Sclerotica, and pass to the Iris.

USE OF THE PARTS OF THE EYE.

126 The Cornea collects and bends inward the rays of light reflected towards it from surrounding objects.

Answ

- 127 The Aqueous Humour allows them a ready passage, and admits freely of the motions of the Iris.
- 128 The Crystalline Lens still further concentrates the rays of light, so as to make a distinct image at the bottom of the Eye.
- 129 The Vitreous Humour, filling the Membranes, supports the figure of the Eye, which is essential to the due performance of its office, and maintains the Lens at its focal distance from the Retina.
- 130 The Retina perceives the picture formed upon its surface by the due collection, refraction and transmission of the rays of light.
- 131 The Choroid is the Vascular Coat of the Eye, allowing the ramification of vessels, and secreting the Nigrum.

 Pigmentum.
- 232 The Nigrum Pigmentum prevents the reflection of the rays of light when once they have reached the Retine, and thus confusion is avoided.
- The Iris, by contracting, excludes all the superfluous rays reflected from a luminous body, or by expanding, admits through the Pupil all that pass through the Cornea, in case any object should be sparingly lighted.
- 234 The Sclerotica by its figure bounds the form of the Eye, and by its strength protects and supports the parts which it contains.

Sect. XXXI. ORGAN OF SMELL.

SECTION XXXI.

OF THE ORGAN OF SMELL.

Answ.

- 1 The Organ of Smell, or Nose, is much more extensive than would be conjectured from the external prominent part to which the name of Nose, in common language, is given. It is a double cavity, divided by a perpendicular partition.
- 2 It is *situated* between and below the orbits, above the mouth and below the forehead.
- 3 It is divided into its external prominent part, properly called Nose, and its internal Cavity.
- 4 The External Part consists of the Root of the Nose, the Arch of the Nose, the Tip of the Nose, the Alæ and the Nostrils, or anterior openings of the Cavities of the Nose.
- 5 The Internal Part, or Cavity, contains the Septum Narium, the turbinated Bones, the posterior Openings of the Nares, the Frontal, Maxillary, and Sphænoidal Sinuses, the Palatine Duct, and Ductus ad Nasem.
- 6 The bony parts of this Organ are, the Os Frontis, Os Ethmoides, Os Sphænoides, Ossa Maxillaria, Ossa Nasi, Ossa Lachrymalia, Ossa Palati, Vomer, Inferior Turbinated Bones and Cartilages.
- 7 The soft parts are the Integuments, Muscles, Pituituary Membrane, Vessels, Nerves, and Hairs of the Nares,

Sect. XXXI. ORGAN OF SMELL.

Answ.

- 8 The Root and Arch, or Dorsum, of the Nose are formed by the Nasal process of the Superior Maxillary Bone, and the Ossa Nasi.
- 9 The remainder of the external Nose is composed of five Cartilages.
- 10 The middle one is part of the Septum Nasi, it divides the Nostrils; two placed anteriorly form the tip; and two laterally the Alæ, and these surround the Nostrils.
- 11 The Cavities of the Nose extend from the Nostrils, to the posterior openings of the Nares, immediately above the arch of the Palate. They extend upward to the Cribriform Plate of the Ethmoid Bone, and there communicate, forward, with the Frontal Sinuses; and backward with the Sphanoidal Sinuses. Laterally they are bounded on the inner side by the Septum, and on the outer side by the Maxillary, Lachrymal, Ethmoid, and Turbinated Bones; above the latter they communicate with the Maxillary Sinuses.

PITUITARY MEMBRANE.

- 12 The whole of the Cavities of the Nose are lined by the Pituitary Membrane.
- 13 It serves for the expansion of the Olfactory and other Nerves, for the transmission of Vessels, and the secretion of the fluid which moistens its surface.
- 14 It is thickest upon the Septum Narium, the turbinated Bones, and the lower part of the Nares.

Sect. XXXI. ORGAN OF SMELL.

SINUSES.

Answ.

- 15 The Frontal, Sphænoidal, and Maxillary Sinuses, open into the internal Nares.
- 16 The Frontal Sinuses open into the anterior superior park of the Nares.
- 17 The Sphænoidal Sinuses open into the superior posteries part of the Nares.
- The Maxillary Sinuses open laterally above the inferior turbinated Bones.

DUCTUS INCISIVI.

- 19 The Ductus Incisivi in the human subject usually only exist in the bones, and are filled by soft parts.
- 20 They are situated behind the large superior Dentes Incisivi, between the arch of the Palate and the bottom of the Nares.
- 21 They transmit several Twigs of Arteries and Veins, and sometimes are perforated by Duets, the use of which is at present unknown.

BLOOD VESSELS AND NERVES OF THE NOSE.

- The External Carotids supply the Nose and its Cavities with Blood, the Veins go to the external Jugulars.
- Nerves of Smelling; but the Nose also received.

 Nerves of common sensation from the fifth pair.

SECTION XXXII.

OF THE ORGAN OF HEARING.

Answ.

1 The Organ of Hearing, commonly called, the Ear, is twofold, there being a distinct and perfect Organ situated on each side of the Head, the most important parts of which are formed in, and contained by the Temporal Bone.

2 Each is divided into the external and internal Ear.

EXTERNAL EAR.

- 3 The External Ear consists of a considerable Cartilage invested by common Integuments.
- A It is divided into three parts, namely, the Pinna, Lobus, and Meatus Auditorius Externus.

PINNA.

- 5 The Pinna forms the greater part of the outer Ear.
- 6 It consists of the Cartilage, invested by common Integuments.
- 7 On its anterior or external side are four Eminences, namely, the Helix, Antihelix, Tragus, and Antitragus.
- The Helix forms the large external margin, or hem, of the outer Ear, and extends across its middle.

Answ.

- 9 The Antihelix is the oblong elevation forming an inner margin, and immediately surrounded by the Helix.
- 10 The Tragus is the small anterior protuberance below the anterior end of the Helix.
- 11 The Antitragus is the posterior protuberance below the inferior, end of the Antihelix, and opposite the Tragus.
- 12 There are three depressions on the Pinna, namely, the Fossa Navicularis, the Fossa Innominata, and the Concha.
- 13 The Fossa Navicularis is placed in the bifurcation of the superior extremity of the Antihelix.
- 14 The Fossa Innominata is situated between the anterior and superior extremities of the Helix and Antihelix.
- 15 The Concha is the great Cavity surrounded by the Antihelix, and divided transversely by the anterior part of
 the Helix, which on this account, is called, the
 Septum Conchæ.
- sures noticed in the Cartilage which forms the Pinna, viz. one situated upon the anterior part of the Helix; one between the terminations of the Helix and Antihelix; and two in the base of the Trague, or perhaps more properly in the commencement of the Meatus Externus.
- 17 Three Ligaments fix it in its place, namely, a superior, an anterior, and a posterior.
- 18 The Muscles have been described at page 125.

Vol. II.

Answ.

19 The Integuments of the Pinna are plentifully supplied with Sebaceous Glands.

LOBULUS.

- 20 The LOBE forms the inferior extremity of the External Ear.
- 21 It consists of skin and cellular substance.

MEATUS AUDITORIUS EXTERNUS.

- 22 The Meatus Auditorius Externus extends from the bottom of the Concha inward, to the Membrana Tympani.
- 23 It is directed inward, forward and upward, and is, in its course, a little curved downward.
- 24 It is about an inch long,
- 25 Wider at its extremities than in the middle.
- 26 Its bore is not quite circular, but a little oval.
- 27 It consists in part of Cartilage continued from the Pinna, and in part of Bone.
- 28 The bony portion is the longest in the adult; but in the fœtus the Meatus Auditorius is wholly cartilaginous.
- 29 'The Cartilaginous Portion has two fissures; one of which is situated immediately under the Tragus, and the other at a little distance from it.
- To It is lined by a continuation of the Integuments of the Concha, under which the Ceruminous Glands are placed, especially towards the Concha;

Answ

*1 They secrete the Cerumen, or Ear Wax, which is discharged through small excretory ducts, into the Meatus Auditorius.

ARTERIES, VEINS, AND NERVES OF THE EX-TERNAL EAR.

- The External Ear receives its Arteries anteriorly, from the *Temporal*; and, posteriorly, from the *Occipital Artery*.
- 33 Its Veins pass to the External Jugular.
- 34 Its Nerves are derived from the Portio Dura, and second Vertebral Pair.

INTERNAL EAR.

35 The Internal Ear is divided into three parts, namely, the Tympanum, Labyrinth, and Meatus Internus.

MEMBRANA TYMPANI.

- The Membrana Tympani is situated at the bottom of the Meatus Externus, forming the external side of the Tympanum.
- 37 It is fixed in a bony groove.
- 28 It is of an oval form, placed obliquely; its upper part being turned outward, and its lower part inward.
- 39 It is slightly concave externally.

Answ.

- 40 It is composed of two laminas; of which the internal is a production of the Periosteum of the Tympanum; and the external of the Cuticle lining the Meatus Externus; which, by Maceration, may be removed like the finger of a glove.
- 41 The Mallous, a very small bene contained in the Tympanum, is attached to this Membrane, and across its upper part runs a small Nerve, called, Chorda Tympani.

TYMPANUM.

- The Tympanum is a Cavity situated immediately within the Membrana Tympani, in the substance of the Temporal Bone.
- its form is irregular, resembling a portion of a Cylinder; its outer side is formed by the Membrana Tympam; its inner side is bony, and divides this Cavity from the Labyrinth; its circumference is irregular.
- one anteriorly from the Eustachian Tube, and another posteriorly to the Mastoid Cells.
- 45 It is lined by a Vascular Periosteum.
- At. It contains Air, and the Ossicals Auditus, with their Muscles and Ligaments.

EUSTACHIAN TUBE:

47 The Eustachian Tube extends from the Cavity of the

Answ.

Tympanum to the root of the It. Tygold process of the Sphemoid Zone; here is opens into the upper part of the Fauces, just behind the posterior Narcs.

- 48 It consists of a bory, a carriloginess, and a recombiness portion.
- 49 The extremity towards the Tymponi is wholly of done; of the rest, bone forms only the upper part.
- 50 Cartilage forms the internal, and Membrane the external parts of its lower side.
- 51 Its bony part is by much the narrowest, it expands in the form of a trumpet towards the mouth.
- 52 These Tubes, one for each ear, are directed from the Tympanum obliquely inwards, downwards, and ferwards; so that their anterior extremities, in the Fauces, are the nearest to each other.
- 53 They are lined by a Membrane resembling that of the Nares.

MASTOID CELLS.

- 54 The Mastord Cells open into the posterior and upper part of the Tympanum, by a considerable aperture.
- 55 In the adult the Mastoid process of the Temporal Bone is -wholly cellular.
- 56 They are lined by a Vascular Periosteum.
- 57 They contain air.

BONES OF THE EAR.

Answ.

in number, namely, the Malleus, the Incus, the Os
Orbiculare, and the Stapes.

39 They form a kind of chain from the Membrana Tympani

to the Labyrinth.

Membrana Tympani; next to this is the Incus; then the Os Orliculare; and lastly, the most internal is the Stapes.

MALLEUS.

- 61 The Malleus, or Hammer, is placed upon the inner side of the Membrana Tympani, to which it is fixed by its handle.
- pani, having its extremity turned downward; a short process at the top of the handle; also turned toward the Membrana Tympani; a long process, called, Processus Gracilis, which is turned forward, over the inner edge of the ring of the Membrane; a neck which projects inward from the handle, forming an angle with it, and surmounted by a round head, by which it is connected to the Incus.
 - 63 This Bone has three Muscles, described at page 126, gamely, the Tensor Tympani, fixed to the posterior

Answ.

and upper part of its handle; the Laxator Tympani Major, attached to its long process; and the Laxator Tympani Minor, fixed near its short one.

INCUS.

- 64 The Incus, or Anvil, is situated between the Malleus and Os Orbiculare, extending backward toward the Mastoid Cells.
- 65 It consists of a Body, a short and long leg: its Body is articulated with the head of the Malleus; its short leg rests on the opening of the Mastoid Cells, and its long leg bends inward and downward to the Orbiculare.

OS ORBICULARE.

- 66 The Os Orbiculare, the smallest bone in the Body, being not larger than a small pin's head,
- 67 Is placed between the point of the long Leg of the Incus, and the head of the Stapes.
- 68 It is of a flattish circular form.

STAPES.

- 59 The Stares, or Stirrup, is placed immediately behind the Os Orbiculare, and extends to the Finestra Ovalison the inner side of the Tympanum.
- 70 It precisely resembles a stirrup, having a small head,

Answ.

which is fixed to the Os Orbiculare; two legs forming the arch, of which the posterior is longest, and which are grooved internally; and a flat base, whose edge is curved superiorly, straight inferiorly, and fixed in the Finestra Ovalis.

- 71 A fine Membrane fills the space between the Legs;
- 72 It is fixed in the groove on their inner sides.
- 73 The Stapedius Muscle is attached to its head.

INNER SIDE OF THE TYMPANUM.

- 74 Toward the upper part of the inner side of the Tympanum is an oval hole, placed horizontally, called, FINESTRA OVALIS.
- 75 The Basis of the Stapes is fixed in it.
- 76 The FINESTRA ROTUNDA is small, placed toward the lower part, and covered by a Membrane;
- 77 It is nearly circular.
- 78 Immediately over the Finestra Rotunda is situated a rounded eminence, called, the Promontary.
- 79 Immediately behind the Finestra Ovalis, near the circumference of the Tympanum is a small projection, with an opening at its apex, called, the *Pyramid*, it contains the Stapedius.
- 89 The course of the Fullopian Aqueduct is marked by a rising which passes first above the Finestra Ovalis, then behind it and the Finestra Rotunda.
- 81 On the inner side of the opening of the Mastoid Cells is 2

Answ.

protuberance, which corresponds with a part of the Labyrinth, called, the External Semicircular Canal.

LABYRINTH.

- 22 The LABURINTH is situated within the substance of the Petrous Portion of the Temporal Bone.
- 63 It consists of several contorted Cavities, which communicate with each other, and are divided into three, viz. the Vestibulum, Semicircular Canals, and Cochlea.
- brane, formed by the ramifications of the Portio Mellis of the seventh pair of Nerves, Blood Vessels, and alimpid Fluid.

VESTIBULUM.

- •5 The Vestibulum occupies the middle of the Labyrinth; the Cochlea being placed before, and the Semicircular Canals behind it.
- 83 It is of an oval figure, but irregular, having an hemispherical depression below, a Semioval depression above, and a groove-like sulciform depression behind, leading to the Aqueductus Vestibuli.
- 87 The Finestra Ovalis opens into its external side.
- openings belonging to the semicircular canals; and one very small of the Aqueduct of the Vestibulum.
- 19 On the anterior side there is only one opening, which

Answ.

leads to the external, or Vestibular Scala of the

- 90 The Aquiductus Vestibuli passes in a curved direction backward and inward;
- 91 It opens externally about half an inch behind the Meatus
 Internus, upon the posterior side of the Os Petrosum.

SEMICIRCULAR CANALS.

- 92 The Semicircular Canals are situated behind the Vestibulum.
- 93 They are three in number.
- 94 They are named, the superior, posterior, and external, or horizontal.
- 95 They terminate in the Vestible by five openings only,
- 96 Because one end of the superior, and another of the posterior Canal meet, and form a common opening.
- 97 Each canal has one of its extremities of an eliptical form, and more expanded than the other, called, its Ampulla.
- 98 The Ampullæ of the superior and posterior Canals are at their separate openings.
- 99 The Ampulla of the external Canal is at its superior, or external opening.

COCHLEA.

Too The Cochlea is situated immediately before the Vesti-

Answ.

- bulum, with its base towards the Meatus Auditorius. Internus.
- 1.01 It is a double *spiral*, *conical Canal*, resembling the shell of a snail internally.
- 102 This Canal performs two turns and a half.
- 103 It is divided into two by a Septum, partly bony and partly membranous; the bony part is called, Lamina Spiralis; the membranous part, Zona Mollis: the Zona Mollis proceeds from the edge of the Lamina Spiralis to the opposite side of the Canal.
- 104 The two Canals, resulting from this division, are called, the Gyri, or Scalæ;
- is called, Scala Vestibuli; the other is situated internally, terminates at the Finestra Rotunda, and is called, Scala Tympani.
- 106 The two Scalæ communicate at the apex of the Cochlea.
- 107 They wind round a conical pillar, called, Modiolus.
- hollow cone, called, *Infundibulum*, whose basis is turned toward the apex of the Cochlea, called, *Cupola*.
- 109 One edge of the Lamina Spiralis is fixed to, and winds round the Modiolus;
- 110 Its apex is a hook-like point, called, Hamulus; it ends in the Infundibulum.
- 111 There are numerous small apertures on each side of the

. Answ.

Lamina Spiralis and the M.dolus, which transmit the filaments of the Portio Mollis.

These ramify chiefly upon the Lamina Spiralis and Zona Mollis.

MEATUS AUDITORIUS INTERNUS.

- 113 The Meatus Auditorius Internus is situated on the posterior side of the Os Petrosum.
- 114 It is a short tubular Canal of some size, terminated by two Fossula.
- 115 One of them is the superior, and the other the inferior Fossula.
- 116 They are separated from each other by a spine, or bony ridge.
- 117 The Meatus Internus contains the Portio Mollis, and
 Portio Dura of the seventh pair of Nerves, with a
 small artery.
- 118 From the upper part of the superior Fossula proceeds
 the Aqueductus Fallopii;
- 119 It passes outward through the upper part of the Os Petrosum, then bends downward and backward, laying on the inner side of the Cavity of the Tympanum, behind and above the Finestra Ovalis;
- 120 It terminates in the Foramen Stylo-Mastoideum;
- 121 It transmits the Portio Dura, or Facial Nerve, which
- 122 Is joined first by a twig of the Vidian Nerve, through a Foramen on the upper and forepart of the Os Petro-

- sum: then by the Chorda Tympani, from the Cavity of the Tympanum.
- 193 Just where it is about to turn downward over the inner side of the Tympanum, the Vidian Nerve joins it.
- 124 A little before it makes its exit by the Foramen Stylo-Mastoideum, the Chorda Tympani meets it.
- the Tympanum, between the handle of the Malleus and the long leg of the Incus, and passes through the Fissura Glasseri.
- 126 The Portio Mollis, entering by numerous small apertures, is spread out within the Labyrinth, in the form of a delicate pulpy Membrane, giving a lining to it in addition to the Periosteum.

USE OF THE PARTS OF THE EAR.

- 127 The Pinna collects the sonorous undulations of the air, and reflects them towards the Meatus Auditorius Externus;
- 128 This trumpet-like tube consensuates and conveys the sound to the Membrana Tympani, which
- 129 Transmits the Vibration of the Change Contained in the Cavity of the Tympanum.
- 130 The Muscles of the Market over fixed regulate the tension of the Wards on Two, we relating is to moderate sounds, and bracing it to perceive faint ones.
- 131 The Eustach of Teer admits the face passage of air into and from the Cavity of the Tympanum, thus pre-

Answ.

serving a due balance with the external atmosphere, and enabling the Membrana Tympani to move in obedience to the slightest impressions.

vibrations they receive from the Membrana Tympani, and transmit them to the water contained in the Labyrinth;

This Fluid, being incompressible, faithfully transmits and conveys the undulations it receives, all over the Nervous Membrane which lines the Labyrinth.

out in the form of a fine Membrane within the Labyrinth, is the part which perceives the impressions of sound and transmits them to the Sensorium.

SECTION XXXIII.

OF THE MOUTH, AND ORGAN OF TASTE.

The Mouth does not (anatomically speaking) mean merely the transverse opening bounded by the Lips, but the whole Cavity to which this leads, as well as the parts adjacent.

2 The superior and the inferior Maxillary Bones, Ossa Pa-

lati, and Teeth, form its bony parts.

3 The Mouth is divided into external and internal parts.

EXTERNAL PARTS OF THE MOUTH.

Answ.

- 4 The two Lips, and the Cheeks, form the external parts of the Mouth.
- 5 They consist of Muscles, covered externally by the common Integuments and Fat, and lined internally by a Vascular Membrane, which covers numerous mucous Glands.
- 6 The red edges of the Lips are turned towards each other, highly vascular and sensible, being supplied with numerous Villi.
- 7 The Corners, or Commissures, are formed by their union.
- * The Fossula of the upper Lip is a groove extending from the Septum Nares, and in some is double.
- 9 The Fræna, one for the upper and one for the lower Lip, are folds of the internal Membrane which fix the Lips to the Jaws, opposite the Incisor Teeth.

INTERNAL PARTS OF THE MOUTH.

The Internal Parts of the Mouth are the Gums, the Palate, the Tongue, the Amygdala, and the Salival Glands and Ducts.

GUMS.

Answ.

- 11 The Gums cover both the sides of the Alveelar processes, and surround the necks of all the Teeth.
- 12 They are composed of a firm, spongy, elastic, and very vascular substance,
- 13 Firmly adhering, by means of the Periosteum, to the Alveolar processes.
- 14 They are covered by a fine Membrane, which is a continuation of that which lines the Lips and Checks.

PALATE.

- 15 The PALATE is surrounded by the Teeth of the upper Jaw, and extends to the great opening of the Pharynx.
- 16 It resembles an arch.
- 17 It is distinguished into the hard and soft Palate.
- 18 The hard Palate is the most anterior, and is composed of the Palatine processes of the upper Jaw, and Ossa Palati.
- 19 The Membrane which covers it resembles that which lines the superior and middle parts of the Pharynx, studded with small glands.
- 20 The soft Palate, or Veium Palati, is formed by a continuation of that Membrane which lines the hard Palate and the Cavity of the Neco, and by various muscles lying in this duplicature.
- 21 It resembles an arch, placed transversely above the root

Answ.

of the Tongue, and forming anteriorly one continued surface with the hard Palate.

- 92 From the middle of this Arch hangs the Uvula.
- 23 It is a conical Body,
- 24 Formed by a small Muscle enveloped in the glandular Membrane, which lines all these parts.
- 25 From the *Uvula* proceed two folds downward and to each side, called, the *Arches of the Palate*, so that the arch is on each side double.
- 26 The anterior arch runs towards the side of the basis of the Tongue; and the posterior towards the side of the Pharynx.
- Between the anterior and posterior arch of the Palate, on each side an irregular glandular body is placed, called, the Tonsil, or Amygdal Gland.

TONGUE.

- 28 The Tongue is divided into a basis, and apex; a superior and inferior side, and two edges.
- a9 It chiefly consists of soft muscular fibres, intermixed with a medullary, or fatty substance.
- over with small eminences, and covered by a continuation of the Cuticle; it is likewise continued over the lower side, but here it is smooth, forming only a fold in the middle, called, Franum.

OF THE MOUTH AND TASTE. Sect. XXXIII.

Answ.

31 The small eminences of its superior surface are called Papillæ.

32 There are three kinds, distinguished by the variety in their figure.

33 The Papillæ Capitatæ are situated on the basis of the Tongue, in small Fossulæ.

34 They resemble in miniature a mushroom, having a narrow neck, and being depressed in the middle:

35 They secrete a salival, or mucilaginous fluid.

36 The Papillæ Semilenticulares are placed chiefly in the middle and anterior parts of the Tongue.

37 They are slightly convex and cylindrical, and next in size to the Capitatæ.

38 The Papillæ Velosæ occupy the whole surface of the upper side of the Tongue, and even the interstices of the other Papillæ;

39 They are of a conical form, and the smallest Papillæ of the Tongue.

SALIVAL GLANDS.

- 40 Three glandular bodies, situated on each side of the face, secrete the Spittle, or Saliva; namely, the Parotid, the Submaxillary, and the Sublingual Glands.
- 41 Numerous minute Glands, distributed under the Membrane lining all the parts of the Mouth, contribute to increase the fluids of the Mouth, there are named from the parts on which they are s tuated, viz.

The Labiat, on the ms do of the L.ps;

Answ.

The Palatine, on the Palate;
The Lingual, on the Tongue;
The Buccal, on the inside of the Cheeks, &c. &c.

PAROTID GLANDS.

- 42 The Parotto is the largest of the lateral Glands, it is situated between the external Ear and the Ramus, and angle of the lower Jaw, extending over some part of the Masseter.
- 43 Its Excretory Duct, called STENO's Duct, arises from several lesser ducts at its anterior and upper part.
- 44 It passes obliquely over the outside of the Masseter.
- 45 It perforates the Cheek, and opens into the Mouth opposite the Interstice, between the second and third Molar Teeth.

SUB-MAXILLARY GLANDS.

- The Submaxillary Gland is situated on the inside of the angle of the lower Jaw, near the internal Pterygoid Muscle.
- 47 Its Excretory Duct, or Wharton's Duct, proceeds from that side of the gland which is turned to the Hyoglossus.
- 48 It advances between the Genio-Giossus and Mylo hyoideus, under the Sublingual Gland.
- 49 It opens on one side the Frænum of the Tongue.

OF THE MOUTH AND TASTE. Sect. XXXIII.

SUBLINGUAL GLANDS.

Answ.

- 50 The Sublingual Gland, the smallest, is situated under the anterior portion of the Tongue, between the Genio-Glossus and Mylo-hyoideus.
- 51 It has several small ducts, which open close under the side of the Tongue, near the Gums, a little further back than the Frænum.

AMYGDALE.

- 52 The AMYGDAL GLAND, or Tonsil, is situated in the interstice between the arches of the Palate on each side.
- 53 It somewhat resembles the outside of an almond shell, being uneven and covered with several Foramina.
- 54 It is filled with numerous and large Follicles.
- 55 They secrete a viscid fluid.

THYROID GLAND.

- 56 The THYROID GLAND is situated on the anterior and inferior part of the Neck: its middle portion lies on the Crico-Thyroidei, and its lateral portions on the Thyro-Hyoidei Muscles.
- 57 It seems to be composed of two oblong portions, united by their inferior extremities, so as to have some resemblance to a crescent.
- 58 Its use, though not understood, appears to be connected with those of the Mouth.

Sect. XXXIV. OF THE SKIN AND TOUCH.

SECTION XXXIV.

OF THE SKIN, AND OF THE ORGAN OF TOUCH.

Answ.

- 1 The Skin, or Common Integument, consists of three parts, namely, the Cuticle, Rete Mucosum, and Cutis, having in most parts the Adipose Substance situated under them.
- 2 The Cuticle is the most external, immediately under it lies the Rete Mucosum, covering the Cutis, which is the most internal, and by much the most thick.

CUTIS.

- 3 The Cutis consists of a close intertexture of fibres, plentifully supplied with blood vessels and nerves.
- 4 It is thickest on the palms of the hands and soles of the feet.
- 5 The Papillæ are numerous small eminences on its external surface, in which the Capillary Filaments of the Cutaneous Nerves terminate in radiated Pencils.
- They are most prominent on the palms of the hands and soles of the feet, and on the fingers and toes.
- 7 They are arranged in double rows, which are regularly placed as parallel, crooked, waving, or spiral lines.
- 8 On the red part of the Lips they resemble fine Hairs, or Villi.
- 9 The Papillæ are the parts in which the Sense of Touch

Sect. XXXIV. OF THE SKIN AND TOUCH.

Answ.

resides; it is more particularly acute at the ends of the fingers, where the regular concentric rows of the Papilæ are remarkable.

Numerous Sebaceous Follicles exist in the substance of the Skin, and open on its surface.

11 They are most conspicuous about the Nose, Cheeks, Ears, Armpits, Groins, and Genitals.

12 They secrete an unctuous fluid which protects the Skin from the effects of heat and friction.

13 Besides the apertures of the Sebaccous Follicles, there are noticed, openings for the Hairs, and others very minute, called, Pores, which are the terminations of the exhalent vessels.

RETE MUCOSUM.

- 14 The Rete Mucosum is a delicate substance situated every where between the Cuticle and Cutis, surrounding the Papillæ of the Cutis, and lying in the interstices between them.
- 15 It is white in the Europeans and northern Asiatics; but black, or of a dark brown, in the Indians, Africans, and Americans, so that it is the seat of colour.

CUTICLE.

The CUTICLE is a delicate transparent Membrane, covering the Rete Mucosum and Cutis.

Sect. XXXIV. OF THE SKIN AND TOUCH.

Answ.

- 17 It is thickest in the palms of the hands and soles of the feet.
- 18 It dips in betwixt every minute fold of the Cutis, and into every aperture on its surface.
- 19 It does not appear to be organized, nor does it possess any sensibility.

ADIPOSE SUBSTANCE.

- Drane in various parts of the body, but a layer of it is uniformly found closely adhering to the Cutis, in most parts, and on this account it has been by many considered as part of the common covering.
- 21 The Skin of the Eyelids, Penis, and Scrotum, are wholly free from it.
- 22 It consists of an Oleagenous Fluid, contained in distinct cells, which do not appear to have any communication with each other.
- 23 This is most remarkable under the Skin, where it puts on a granulated appearance.
- guards against pressure, and lessens the specific gravity of the body.

NAILS.

- 25 The Nails are considered as a continuation of the
- 26 They appear as if implanted under a fold of the Cutis,

Answ.

- 27 And adhere to a similar doubling of the Cuticle.
- 28 They resemble horn in their structure.
- 29 They grow from the surface of the true skin, on which they lie, and their fibres shoot forward from their roots.

HAIRS.

- 30 The HAIRS grow from roots, called Bull's, which are situated in the Cutis.
- 31 The Bulbs are small pulpy bodies, invested by a Membrane.
- 32 From the Bulbs the Hairs proceed betwixt the Papilla, and pierce the Cuticle.
- 33 Each Hair appears to be a bundle of minute filaments, covered by a membrane.

SECTION XXXV.

OF THE BRAIN IN GENERAL, AND OF ITS MEMBRANES.

- i The Brain is all that pulpy mass, which, with the Membranes that invest it, fills the Cavity of the Cranium.
- 2 It is divided into the Cerebrum and Cerebellum.
- 3 It is enveloped by three Membranes, namely, the Pura Mater, Tunica Arachnoides, and Piamater.

DURA MATER.

Answ.

- 4 The DURA MATER is the most external, and by far the most dense, of the three Membranes; it lines the inside of the Cranium, to which it firmly adheres, and separates and supports the various portions of the Brain by means of Duplicatures, or Processes.
- 3 It consists of two Laminæ.
- 6 The External Layer adheres every where to the internal surface of the Cranium, but most firmly at the Sutures.
- 7 The Internal Layer forms a smooth, polished, and lubricated surface.
- **8** Large duplicatures of the internal Lamina form the processes of the *Dura Mater*.
- 9 These are the Falx Cerebri, the Tentorium, the Fata Cerebelli, and the Sphænoidal Folds.
- opposite the duplicatures of the internal one, where triangular channels are formed, called, the Sinuses of the Dura Mater: these are the veinous reservoirs of the Brain.

FALX.

The FALK CEREBRI forms a partition along the upper and middle part of the Cavity of the Cranium, extending from the edge of the Crista Galli, along the Sagittal Suture, to the middle of the Tentorium.

Answ.

- 12 Its shape is that of half a crescent; the broadest part, or basis of which, is turned backwards, and joins the Tentorium.
- 13 It passes between the hemispheres of the Cerebrum, so that it supports either in the various positions of the head.

TENTORIUM.

- 14 The Tentorium is stretched across the posterior part of the Cavity, being fixed to the Os Occipitis, along the grooves of the lateral Sinuses, and to the angles of the Ossa Petrosa, as far as the posterior Clynoid process of the Os Sphænoides.
- 15 It is broadest at its middle, where it is united to the Falx. Cerebri.
- 16 It separates the Cerebrum from the Cerebellum, and supports the posterior lobes of the former.
- 17 At its anterior part there is an oval notch, through which pass the parts which unite the Cerebum and Cerebulum.

FALX CEREBELLI.

18 The FALX CEREBELLI descends from the middle of the Tentorium, along the inner spine of the Os Occipitis to the Foramen Magnum.

19 It is placed between the Hemispheres of the Cerebellum-

SPHENOIDAL FOLDS.

Answ.

- There are two lateral folds, one on each side of the Sellæ Tursica, joining the anterior and posterior Clynoid processes; also two anterior folds at the edges of the Sphænoidal Fissures.
- 21 The lateral ones form the Fossula for the Pituitary Gland, and the anterior ones divide the anterior from the middle lobes of the Cerebrum.

ELONGATIONS OF THE DURA MATER.

- 22 They are productions of both its Laminæ, which pass: out of the Cranium by various apertures.
- 23 The most important passes through the great Foramen, and lines the great Canal of the Vertebræ; the others pass out along with the Cerebral Nerves.

SINUSES OF THE DURA MATER.*

- The Sinuses of the Dura Mater have been noticed as triangular canals, or veinous reservoirs, placed in the substance of that membrane, and
- 25 Formed by the separation of its two layers.
- 26 The GREAT SINUSES are the superior longitudinal in the convex edge of the Falx Cerebri, terminating in the
- *The Sinuses of the Dura Mater are described in their proper place, along with the other Veins.

Answ.

edge of the Tentorium; the Torcular Herophilate formed between the basis of the Falx Cerebri and the middle of the Tentorium. The LESSER SINUSES are the inferior longitudinal, the occipital, the superior and the inferior petrosal, the cavernous, and the circular around the Sella Tursica.

ARTERIES AND NERVES OF THE DURA MATER.

- 27 The ARTERIES of the Dura Mater are distinguished int anterior, middle, and posterior.
- 28 The anterior come from those of the Orbit.
- 29 The middle artery, or the Arteria Meningea Media, is branch of the External Carotid.
- 30 The posterior come from the Vertebral Arteries.
- 11 It receives its Nerves from the trunk of the fifth pair, its entry into the Cavernus Sinus; and from the eighth pair, as it passes out of the Cranium.

PIAMATER.

- 32 The PIAMATER surrounds, and closely invests, the who mass of the Brain.
- 33 It consists of two very fine Laminæ.
- 84 The external is called, the Tunica Arachnoides, a delica transparent membrane;
- 35 It is spread uniformly over all its convex surface; while
- 36 The Internal Layer, to which the name of Piamater now confined, forms numerous Plica, Duplicature

Answ.

and Septa, which pass every where between the folds of the Cerebrum and Cerebellum.

27 This internal Layer is highly vascular, allowing the vessels of the Brain to ramify in it before they enter that substance.

SECTION XXXVI.

OF THE CEREBRUM.

- The CEREBRUM occupies the greater, or superior, division of the Cavity; above the Tentorium, resting also on the anterior and middle parts of the Basis Cranii.
- 2 It is somewhat of an oval form, convex above, flat below.
- 3 It is divided above into two lateral portions, called Hemi-spheres, between which the Falx Cerebri is placed; and below it is divided into two anterior, two middle, and two posterior Lobes, by transverse depressions.
- 4 The anterior Lobes are situated in the anterior Fossæ of the Basis Cranii.
- 5 The middle Lobes in the middle Fossæ of the Basis Cranii.
- 6 The posterior Lobes on the Tentorium.
- 7 The fissure between the anterior and middle Lobes, is called, the Fissura Magna Sitvii.
- The external surface of the Cerebrum every where consists of tortuous eminences, resembling the windings of the Intestines, these are called its Convolutions.
- g Grooves separate them, which, though apparently shal-

Answ.

low, penetrate deeply into the substance of the Brain into these pass the duplicatures of the Piamater, the are called, the Anfractuosities of the Brain.

- ternal, called, the *Cortical*, or *Cineritious*; and a internal, called, the *Medullary*.
- The Cortical Substance is of a redish ash colour, it form the circumvolutions, and dips down into the Anfra tuosities.
- 12 The Meduliary Substance is of a milk white hue;
- 13 It constitutes the internal mass of the Brain.

CORPUS CALLOSUM.

- ted at the bottom of the Fissure, which divides t two hemispheres.
- 15 It is covered by the Piamater.
- 16 Along its middle runs a groove, called, the Raph bounded on each side by a small Medullary Cord.
- 47 Its edges blend with the Medullary Substance of the to Hemispheres.
- 28 By cutting off the Hemispheres of the Cerebrum, nea even with the Corpus Callosum, there is seen a lar oval mass of Medullary Substance, called, the Ctrum Ovale, of which the Corpus Callosum forms middle part, and the sides are called, the Medulla Arches.

LATERAL VENTRICLES.

Answ.

- 19 The LATERAL VENTRICLES are two Cavities, situated under the Corpus Callosum, and Medullary Arches of the Cerebrum.
- 20 The general course of these Cavities would be represented by the letter X, or two C's turned back to back; they are broad and rounded at their anterior and superior extremities; they then extend backward, gradually separating from each other and contracting; they then bend downward, (after having sent backward a triangular pointed Cavity, which slightly turns inward, called, Cavitas Digitalis, or Posterior Horn,) they lastly turn forward, and terminate under their superior extremities, only more backward and outward.
- 21 At the part where they are nearest to each other, which is just under the Corpus Callosum, there is a delicate partition interposed between them, called, the Septum Lucidum. The parts noticed in the lateral Ventricles are, the Septum Lucidum, the Fornix, the Plexus Choroides, the Corpora Striata, the Thalami Nervorum Opticorum, and the Pineal Gland.
- 22 The SEPTUM LUCIDUM is anited to the Corpus Callosum, derectly under the banks and to the Fornix inferiorly.
- 23 It consists of two Laminæ.
- 24 Between the same and a Carity, which by some has been called, the fifth Ventricle.

FORNIX.

Answ.

- 25 The Fornix is a medullary body, situated immediately, under the Septum Lucidum.
- 26 It is of a triangular figure, one of its edges being posterior, and two lateral.
- 27 It is connected by its superior surface to the Septum Lucidum, and by its posterior edge to the Corpus Callosum, of which it is a continuation.
- 28 The continuations of its angles are called, Pillars, or Crura.
- 29 The posterior pillar on each side follows the course of the Ventricles backwards and downwards, in the form of a thin medullary edge, called Corpus Fimbriatum.
- 20 The anterior Pillar is double, it dips down at the fore-
- 21 Its inferior surface rests on the Thalami Nervorum Opticorum, and is covered by transverse prominent Medullary lines.
- 32 This appearance has been called, Lyra.

CHOROID PLEXUS.

- 33 The PLEXUS CHOROIDES are two membranous loose bodies, of a red and reticular or plexiform appearance.
- 13 They begin small under the anterior part of the Fornix, where they are united; as they pass backwards they

Answ.

- increase and extend themselves throughout the whole course of these Ventricles.
- 35 They are continuations of the Piamater, highly vascular, and containing several Tubercles like Glands, and often little Hydatids.
- When the Fornix and Choroid Plexus have been removed, the eminences of the Lateral Ventricles are conspicuous, viz. the Corpora Striata, and the Thalami Nervorum Opticorum.

CORPORA STRIATA.

- 37 The CORPORA STRIATA are placed at the bottom of the anterior and outer part of the Lateral Ventricles.
- 38 They are pyriform.
- 39 Their anterior large extremities are separated from each other only by the Septum Lucidum, but posteriorly they are at a much greater distance.
- 40 As their name indicates, they are composed of alternate Striæ of the Medullary and Cortical Substances.

THALAMI NERVORUM OPTICORUM.

- 41 The THALAMI NERVORUM OPTICORUM are situated between the posterior extremities of the Corpora Striata.
- 42 They are convex superiorly, and of an oval shape; but their internal sides are flat, smooth, and in contact.
- 43 The Commissura Mollis, a short cord of soft substance,
 Vet. II. T

Answ.

joins them at the middle and anterior part of their internal sides.

- The Tenia Semicircularis is a white, prominent line, lodged in the groove formed between the Corpus Striatum and Thalamus, on each side.
- 45 Their external surface is white, but internally they are composed of medullary and cineritious substance.

PEDES HYPPOCAMPI.

- 46 The Pedes Hyppocampi, or Cornua Ammonis, are two medullary protuberances of a semicylindrical form,
- 47 Situated in the posterior contorted part of the Lateral Ventricles.
- They describe a curve, whose convexity is directed outwards, following the course of the Ventricles.
- 49 'Their terminations at the extremity of the Ventricles are rounded, and present two or three little smooth tubercles.
- 50 The Corpora Fimbriata run along their internal concave edges.
- They are composed of meduliary substance externally, and of cortical substance internally.

HYPPOCAMPUS MINOR.

52 The Hyppocampus Minor, or Ergo, is an oblong medullary protuberance, situated in the Cavivas Digitalis, or posterior horn of each Ventricle.

Answ.

- 53 It is of the same form, and takes the same course as the Cavity.
- 54 It is connected with the posterior pillar of the Fornix, from which it seems to proceed.

PINEAL GLAND.

- 55 The Pineal Gland is situated behind the Thalami Nervorum Opticorum, and above the Tubercula Quadrigemina, under the posterior part of the Fornix.
- 56 It is irregularly round, and sometimes of a conical form.
- 57 It is connected to the lower part of the Thalami by two medullary Peduncles.
- 58 It consists mostly of cortical substance, and generally contains a gritty matter.
- 59 Its base is connected with the posterior Commissure of the Cerebrum, which is
- 60 A transverse medullary Cord towards the posterior part of the third Ventricle.

TUBERCULA QUADRIGEMINA.

- 61 The Tubercula Quadrigemina, are two pairs of medullary eminences, situated behind the Thalami Nervorum Opticorum, and under the Pineal Gland.
- 62 Each is transversely oblong, the superior, called Nates, being a little more rounded and broader than the inferior, called Testes.

Answ.

63 Their surface is Medullary, their inner substance Cineritious.

APERTURES IN THE LATERAL VENTRICLES.

- 64 The FORAMEN OF MONRO is an aperture of communication between the two lateral Ventricles;
- 65 It is situated just behind the anterior pillars of the Fornix, and over the forepart of the third Ventricle.
- 66 The Foramen Commune Anterius, or Vulva, is an opening of communication with the third Ventricle;
- 67 It is situated before the Thalami, behind the anterior Commissure, and just under the Foramen of Monro.
- 68 The Foramen Commune Posterius, or Anus, is stopped by the Choroid Plexus, when parts are in their natural situations;
- 69 It is situated before the Posterior Commissure, and behind the Thalami.

*THIRD VENTRICLE.

- 70 The THIRD VENTRICLE is the space between the Thalami Nervorum Opticorum.
- 71 At its forepart it extends downwards under the anterior Commissure, and terminates in the Infundibulum,
- 72 A funnel-like membranous Tube, which leads to the Pitultary Gland.
- 73 From its posterior part proceeds the Iter-a-tertio-ad-quar-

Answ.

74 This passes under the Tubercula Quadrigemina, and terminates in the fourth Ventricle.

PITUITARY GLAND.

- 75 The PITUITARY GLAND is situated in the Sella Tursica.
- 76 It is transversely oval, and is sometimes, on the lower part, divided into two lobes by a small notch.
- 77 It seems to be of peculiar substance, neither cerebral nor glandular.

SECTION XXXVII.

OF THE CEREBELLUM.

- 1 The CEREBELLUM is situated in the inferior Cavity of the Cranium, under the Tentorium.
- 2 It is broader laterally than before or behind, and flatted superiorly.
- 3 It is divided into two Lobes posteriorly by the Falx Cerebelli.
- 4 It has no convolutions, but on its surface are deep concentric Sulci, or Grooves.
- 5 Like the Cerebrum, it consists of two substances, the Certical and Medullary.
- 6 By cutting the Cerebellum vertically from above downward, the arrangement of the two substances may be shown; the medullary appearing within the Cortical

Answ.

like a tree with numerous branches, hence called, Arbor Vitæ.

- 7 The Appendices Veriniformes are two worm like eminences;
- 8 Cae is situated at the anterior and superior part, the other at the posterior and inferior part of the Cerebellum.

FOURTH VENTRICLE.

3 The Fourth Ventricle runs backward and downward along the middle of the Cerebellum.

10 The Iter-tertio-ad-quartum Ventriculum opens into it

anteriorly.

The Valvala Viensensii is situated at the beginning of the fourth Ventricle, immediately behind the Iter-a-tertio-ad-quartum Ventriculum.

12 The posterior terraination is called, Callamus Scripto-

rius.

The Crura Cercielli proceed from the inferior and anterior part of the Cerebellum.

Sect. XXXVIII. OF THE MEDULLA OBLONGATIA.

SECTION XXXVIII.

OF THE MEDULLA OBLONGATA.

Answ.

- 1 The Medulla Oblongata is a large medullary body situated in the middle of the basis of the Cerebrum and Cerebellum.
- 2 It is formed by the union of the Crura of the Cerebrum and Cerebellum.
- 3 The Crura Cerebri and Cerebelli, are the continuations of the Medullary Substance of those parts which unite at the Pons Varolii.
- 4 The Medulla Oblongata terminates posterorly in the Medulla Spinalis which passes down the Vertebral Canal.

PONS VAROLII.

- 5 The Pons Varolli is placed across the union of the Crura Cerebri and Cerebelli.
- 6 It is a transverse semi-annular protuberance.
- 7 Its surface is streaked transversely, and divided into lateral parts by a longitudinal depression.

Sect. XXXIX. OF THE MEDULLA SPINALIS.

CORPORA OLIVARIA AND CORPORA PYRA-MIDALIA.

Answ.

- From the Pons Varolii the Medulla Oblongata descends, becomes conical, and has four longitudinal eminences on its inferior surface, called, the Corpora Pyramidalia, and Corpora Olivaria.
- 9 The Corpora Pyramidalia are placed in the middle, in a longitudinal direction, behind the Pons Varolii.
- 10 The Corpora Olivaria are situated on the outside of the Corpora Pyramidalia.

CORPORA MAMMILARIA.

- 11 The Corpora Mammilaria are two small round medullary bodies, situated very near the Infundibulum.
- They are placed immediately under the basis of the anterior pillars of the Fornix.

SECTION XXXIX.

OF THE MEDULLA SPINALIS.

- The Medulla Spinalis proceeds from the extremity of the Medulla Oblongata.
- 2 It is lodged in the Canal of the Vertebræ.
- 3 It is invested by a continuation of the Membranes of the Brain.
- 4 It is somewhat flattened anteriorly and posteriorly, and a groove runs along these surfaces.

Answ

- 5 Like the Cerebrum and Cerebellum, it consists of a Cortical and Medullary Substance.
- 6 It terminates pointed, at the Os Sacrum; towards its end it consists of bundles of nervous filaments, which has occasioned it to be called, Cauda Æguina.

ANGIOLOGY.

SECTION XL.

OF THE ARTERIES IN GENERAL.

- 1 The ARTERIES are those Blood Vessels which convey the Blood from the Heart to all the parts of the Body.
- 2 They are distinguished from Veins by being whiter, more dense, firmer and more elastic; when cut across presenting a gaping aperture; and, in the living subject, by their pulsatory motion.
- 3 They begin at the Heart by two trunks of equal size, viz. the Pulmonary Artery, from the left Ventricle distributed to the Lungs only; and the Aorta from the right Ventricle, whose branches pervade every part of the body.

Answ.

- 4 The Branches almost always form very obtuse angles with the Trunks above; but less so in proportion to their nearness to the Heart.
- 5 The ultimate branches terminate in five different ways, 1st. in Veins by mere continuity of canal: 2dly. as Exhauents on the Skin, and in the various internal Cavities: 3dly. in Glands, secreting the various fluids: 4thly. in cellular lodies, as in the Penis and Spleen: 5thly. by Anastomosis, or branches of mutual communication between the Arteries.
- 6 They are composed of three coats, viz. A Cellular, or external Coat; an Elastic, or Nervous Coat; a muscular Coat; and a Cuticular, or internal Coat. They are nourished by vessels called, Vasa Vasorum.

OF THE PULMONARY ARTERY.

- 7 The Pulmonary Artery arises from the right Ventricle,.
- 8 Ascends towards the left, passing before the beginning of:
 the Aorta;
- 9 It divides into two, viz. the right and left Pulmonary
 Arteries;
- 10 These ramify throughout the Lungs.
- 11 The right Pulmonary Artery passes behind the Aorta and Superior Cava,
- 12 It is the longest.
- 13 They terminate in minute ramifications which form upon the surfaces of the air cells, the Rete Mirabile Malpighii.

OF THE AORTA.

- 14 The Aorta arises from the superior part of the left Ventricle,
- 15 Opposite the fourth Dorsal Vertebra.
- 16 It ascends obliquely towards the right, it then forms a curve backwards and to the left, ascending as high as the second Dorsal Vertebra: whence it passes downwards and backwards to the left side of the body of the third Dorsal Vertebra, and continues its course along the bodies of the Vertebræ as far as the Os Sacrum, lying a little to the left.
- 17 It is generally divided into the ascending and descending Aorta; and the descending is further divided into the superior and inferior, or Thoracic and Abdominal Portions.
- 18 The Head and upper extremities are supplied from the ascending Aorta, the Trunk and lower extremities from the descending.
- 19 The great Branches of the Aorta are the two Subclavian Arteries, the Carotids, the Caliac, the superior Mesenteric, the Emulgent, the inferior Mesenteric, and the Iliac Arteries.
- 20 The lesser branches are, the Coronary, Bronchial, Œsophageal, Intercostal, inferior Deaphragmatic, Spermatic, Lumbar and Sacral Arteries.
- 21 They all arise in pairs except the Caliac, the two Mesen-

Answ.

teric, some of the Œsophageal, the Bronchial, and sometimes the Sacral.

- 22 The first pair of Arteries are the Coronary:
- 23 Three Arteries are given off from the arch of the Aorta, viz. the Arteria Innominata, or common trunk of the right Carotid and right Subclavian; the left Carotid, and the left Subclavian.
- 24 The Carotids run up directly to the Head,
- 25 Each divides into an external and internal Carotid.
- 26 The External Carotids are distributed to the Face and external parts of the Head.
- 27 The internal Carotids to the Brain.
- 28 The Subclavian Arteries pass behind and under the Clavicles to the upper Extremity;
- 29 They terminate at the upper edge of the first Rib.
- 30 They then take the name of Axillary Arteries.
- 31 The Thoracic Portion of the descending Aorta gives off the Bronchial, Œsophageal, and Intercostal Arteries.
- 32 The Abdominal Portion gives off the Phrenic, Caliac, Superior Mesenteric, Emulgent, Spermatic, Inferior Mesenteric, Lumbar, Sacral, and Iliac Arteries.
- 33 The Phrenic go to the Diaphragm.
- 34 The Cæliae goes to the Stomach, Spleen, and Liver.
- 35 The Superior Mesenteric goes to the Mesentery, small Intestines, &c.
- 36 The Emulgent go to the Kidneys.
- 37 The Spermatic to the Testes.
- 38 The Inferior Mesenteric goes to the great Intestines.
- 39 The Lumbar go to the Loins.

Sect. XLI. ARTERIES OF THE HEART.

Answ.

- 40 The Sacral to the Sacrum.
- 41 The Aorta terminates in the two Iliac Arteries, which pass
- 42 To the Pelvis and lower extremities.
- 43 They divide into the external and internal Iliacs.
- 44 The Internal Iliacs go to the Pelvis.
- 45 The External Iliacs pass to the Thighs and lower extremities,
- 46 They terminate under Fallopius's Ligament.
- 47 The continuations of the External Itiacs on the lower extremities are called, the Femoral Arteries.

SECTION XLI.

OF THE ARTERIES OF THE HEART.

- The two Arteries of the Heart are called, Coronary; there is a right and a left Coronary Artery.
- 2 They arise immediately above the Semilunar Valves.
- 3 The right Coronary Artery passes in the groove between the right Auricle and Ventricle, round the right edge of the Heart to its inferior flat surface; along the middle of which it runs to the Apex.
- 4 The left Coronary Artery is smaller, it passes between the Pulmonary Artery and left Auricle, and then divides into two or three branches; one runs along the middle of the upper surface, another passes round the basis of the flat side, and a third often goes to the Septum Ventriculorum.

Sect. XLII. ARTERIES OF THE HEAD.

SECTION XLII.

OF THE ARTERIES OF THE HEAD.

Answ.

- 1 The Two CAROTID ARTERIES supply the Head.
- 2 The right arises from the Arteria Innominata, and the left is the next capital branch given off by the Aorta.
- 3 They ascend on each side of the Trachea, between it and the internal Jugular Vein, as high as the Larynx, without giving off any branches, and in this course are called, the *Primitive Carotids*.
- 4 Opposite the Os Hyoides they divide into the external and internal Carotid.
- The external is situated before and to the inside of the internal, at their origin.

EXTERNAL CAROTID ARTERY.

- 6. The External Carotid ascends behind the angle of the lower Jaw, passes under the Parotid Gland, and terminates opposite the Condyle of the lower Jaw.
- 7 It gives off nine Branches.
- s They are anteriorly the Survior Thyroideal, the Lingual, the External Maxillary, or Labial, and the transverse Facial; posteriorly the Occipital, the posterior Oris; interiorly the ascending Pharyngeal; and lastly, it divides into the Temporal, and the Internal Maxillary.

Sect. XLII. ARTERIES OF THE MEAD.

- 9 The Superior Thyroideal arises from the igner side of the External Carotid, near its origin.
- 10 Immediately after its origin it bends downwards, and gives branches to the Jugular Glands, the fat and skin; then runs transversely, and is distributed to the Thyroid Gland and Larynx, as well as slightly to the Pharynx.
- 11 The LINGUAL is the second branch from the Trunk of the External Carotid.
- 12 It passes over the Cornu of the Os Hyoides to the Muscles of that Bone and of the Tongue, and to the Sublingual Gland, then loses itself in the Tongue, where it has been called, the Raninal Artery.
- 18 The EXTERNAL MAXILLARY, or Labial, is the third branch from the Trunk of the External Carotid, and arises anteriorly.
- 14 It passes anteriorly over and just before the Masseter, and middle of the lower Jaw; it then runs under the Depressor Anguli Oris, supplying it, the Buccinator, and the Quadratus. It sends off first the Submental below the Chin; next a contorted branch, which, dividing at the Commissure of the Lips, runs along their edges and forms, with its fellow, the Coronaria Labiorum. It then ascends towards the Nose, and is distributed ahout it; it afterwards reaches the inner angle of the Palpebræ and disperses several branches.
- 15 The ASCENDING PHARYNGEAL is the fourth branch from the External Carotid, arising from its inner side.
- 16 It is of small size, and ascends upon the Rectus Anticus

Sect. XLII. ARTERIES OF THE HEAD.

- to the Pharynx; some of its branches enter the Cranium.
- 17 The Occipital is the fifth branch from the Trunk of the External Carotid, and arises posteriorly.
- 18 It passes obliquely before the Internal Jugular Vein, and giving twigs to the Stylo-Hyoideus, Stylo Glossus, and Digastric; it runs between the Styloid and Mastoid Processes, supplying the Muscles and Integuments of the Os Occipitis; it communicates posteriorly with the Vertebral and Cervical, and superiorly with the Temporal Artery.
- 19 The Posterior Auris is the sixth branch from the Trunk of the External Carotid, and arises posteriorly.
- 20 It is distributed to the external Ear.
- 21 The Transverse Facial is the seventh branch from the External Carotid, it arises anteriorly.
- 22 It is small, passes across before the Masseter Muscle, and is distributed to it and the fat of the Cheek.
- 23 The Temporal is the eighth branch which arises from the Trunk of the External Carotid.
- 24 It emerges from the Parotid Gland, ascends over the Zygoma, and divides into an Anterior, Middle, and Posterior branch. The Anterior, or Frontal branch, supplies the Forehead; the Middle, or Parietal branch, partly to the Forehead and partly to the Occiput; and the Posterior, or Occipital branch, to the Occiput.

Sect. XLII. ARTERIES OF THE HEAD.

Answ

- 25 The INTERNAL MAXILLARY commences from the termination of the External Carotid;
- 26 Just below the Cervex of the lower Jaw it bends inward, forward and downward, and then ascends forward to the Spheno-Maxillary Fissure, giving off,
 - 1st. The Arteria Meningea Media, which passes through the Foramen Spinosum of the Os Sphænoides to the Dura Mater.
 - 2dly. The *Inferior Maxillary*, which enters the Canal of the lower Jaw, and goes to the Teeth and Chin.
 - 3dly. The Alveolar, to the back Teeth of the upper Jaw.
 - 4thly. The Infra-Orbitar, which passes along the Infra-Orbitary Canal to the Cheek.
 - 5thly. The Palato Maxillary, which descends in the Canal of the same name to the Palate.
 - 6thly. The Sphano Palatine, to the Cavity of the Nose.
 - Lastly. Various branches to the adjacent parts, 'from which they have received names.

INTERNAL CAROTID ARTERY.

and is situated more posteriorly than the external: it ascends to the Petrous Portion of the Temporal Bone, passes through its canal into the Cavernous Sinus; it there forms another considerable curve by the side of the Sella Tursica, and by the side of the anterior Clynoid Process it pierces the Dura Mater.

U

VOL. II.

Answ.

- Mater, which accompanies the Optic Nerve through the Foramen Opticum, called, the Ophthalmic, which is distributed to the contents of the Orbit. It then divides into three branches, 1st. The Communicans, which runs backwards to join the Vertebral.
- with its fellow from the other side, and then divides into two or three branches, which go to the anterior lobe of the Brain, to the Corpus Callosum, and to the middle lobe of the Brain. 3dly.
- 30 The Media Cerebri, larger than the former, divides into several Rami, which supply the superficial parts of the Brain above and below.*

SECTION XLIII.

ARTERIES OF THE UPPER EXTREMITIES.

SUBCLAVIAN ARTERIES.

- 1 There are two Subclavian Arteries, one going to each Arm.
- The RIGHT SUBCLAVIAN arises from the Arteria Innomata, the LEFT is the third branch which proceeds directly from the arch of the Aorta.
- 3 They pass transversely under the Clavicles, and over the first Rib.
- *The Vertebral Arteries are described as branches of the Subclavian.

- 4 Above the middle of the two first Ribs, between the anterior insertions of the Scaleni, they lose the name of Subclavian, and take that of Axillary Arteries.
- 5 The LEFT Subclavian is shorter, and takes a more oblique course than the right.
- 6 They run some way without giving off any branches; then each gives off six, viz. the Vertebral, the Internat Mammary, the Cervical, the Intercostal, the Inferior Thyroideal, and the Supra-Scapular Arteries.
- 7 The VERTEBRAL arises from the posterior and upper side of the Subclavian:
- 3 It ascends and enters the canal formed in the Transverse Cervical Processes, sending off twigs in its ascent to the Medulla Spinalis and its Membranes, and giving Arteries to the Vertebral Muscles; its course is very tortuous, especially before it enters the Cranium at the Foramen Magnum Occipitale. Before entering the Cranium it communicates with the Cervical and Occipital Arteries, and immediately after it enters it gives branches to the Medulla Oblongata Corpora Olivaria, &c. It then advances on the Basilary Process of the Os Occipitis, here joining its fellow, it forms the Basilary Artery, which communicates with the branches of the Internal Carotid, and is distributed to the posterior lobes of the Brain.
- 9 The branches of communication between the Vertebral Arteries, and the Internal Carotids, surround the Sella Tursica, and form the Circulus Arteriosus.

Answ

- 10 The Internal Mammary arises from the anterior and lower side of the Subclavian;
- 11 It descends behind the Cartilages of the true Ribs, an inch from the Sternum, giving branches to the Thymus, Mediastinum, Pericardium, Pleura, Intercostal Muscles, &c. and passes from the Thorax by the side of the Ensiform Appendix of the Sternum to the Rectus Abdominis, where it communicates with the Epigastric Artery.
- 12 The Cervical arises from the upper side of the Subclavian;
- divides, or its two branches have distinct origins.—
 The Cervicalis Anterior runs behind the Carotid of the same side, and is distributed to the anterior Muscles of the Neck, and to those of the Larynx, Pharynx, &c.—The Posterior Cervical passes under the Transverse Process of the last Vertebra of the Neck, and runs to the posterior Cervical Muscles.
- 14 The Superior Intercostal arises from the lower side of the Subclavian;
- Ribs near their heads, and sends off under each of these Ribs, a branch which runs along its lower edge, and supplies the Intercostal Muscles, contiguous parts of the Pleura, &c.
- 15 The Inferior Thyrotdeal arises from the upper part of the Subclavian, near the internal Mammary.

Answ.

- 17 It ascends, passes behind the Primitive Carotid, and is chiefly distributed to the Thyroid Gland.
- 18 The Supra-Scapular is often a considerable branch, it arises near the former, and sometimes from it;
- Scapula, and is distributed to the muscles at the back and upper part of that bone.

AXILLARY ARTERIES.

- 20 The AXILLARY ARTERIES begin at the first Rib, between the insertions of the Scaleni, being the continuations of the Subclavian;
- 21 Each terminates opposite the lower part of the Tendon of the Latissimus Dorsi, being about four inches long; its continuation is called, the Brachial Artery.
- 22 Each Axillary Artery sends off five or six branches, namely, the External Mammary, or Thoracic Arteries, the Infra-Scapular, the Anterior Circumflex, and the Posterior Circumflex.
- 28 There are usually three or four EXTERNAL MAMMARY Arteries, but two are chiefly noticed.
- 24 The Superior Mammary is the first branch given off from the Trunk of the Axillary.
- 25 It descends between the Pectoralis Major, and Minor, giving branches to them, and to the Serratus Anticus, Latissimus Dorsi, &c.
- 26 The Inferior Mammary is the second branch rising from the Trunk of the Axillary;

Answ

- 27 It runs along the inferior edge of the Pectoralis Major, and is distributed to the adjacent Muscles, Breast and Skin.
- 28 The INDRA-SCAPULAR is the third branch which arises from the Trunk of the Axillary;
- the inferior Costa of the Scapula, sending branches to the Subscapularis, Teres Major, and Minor, and large branches to the posterior part of the Scapula.
 - o The Anterior Circumflex is small, it runs forward under the Coracobrachialis then bends outward, and passes under the Deltoid.
- 31 The Posterior Circumflex is a considerable Vesselfrom the lower and posterior part of the Trunk;
- 32 It runs backward between the head of the Os Humeri and Teres Major, surrounding the Articulation, till it reaches the posterior part of the Deltoid, under which it passes, and is distributed.
 - 33 The Brachial Artery, the continuation of the Subclavian, begins immediately below the Tendon of the Latissimus Dorsi;
 - 24 It descends on the inside of the Arm, over the Coraco-Brachialis and short head of the Triceps, and along the inner edge of the Biceps, to the middle of the bend of the Arm.
 - 35 Besides many small branches to the neighbouring parts, it sends off, 1st. The Profunda Humeri Superior, from the inner side of its upper part, a long branch which passes behind the bone, and communicates with the

Answ.

Radial Artery. 2dly. The Profunda Inferior, about the middle of the Arm, which descends toward the inner Condyle. 3dly. The Anastomodicus Magnus, given off a little above the inner Condyle, communicating with the Arteries of the fore arm.

- 36 At the bend of the Arm it runs under the Aponeurosis of the Biceps, and under the Median Vein.
- 37 A little below the fold of the Arm, it divides into two principal branches, an inner, or posterior, named Cubital; and an outer, or anterior, named Radial.
- 38 The ULNAR Artery passes deep under the flexors of the hand and fingers, to the inner part of the fore-arm, along the outer side of the Flexor Carpi Ulnaris, and Os Pisiforme, to the palm of the hand; passing over the anterior Annular Ligament, and under the Palmar Fascia, and here forming the Superficial Palmar Arch.
- 29 It gives off high up, 1st. The Ulnar Recurrent: 2dly. a. little lower, the Anterior Interosseous Artery: and 2dly. the Posterior Interosseous Artery.
- 40 First, The ULNAR RECURRENT runs to the inner Condyle, then turns up to communicate with branches from the Anastomodicus.
- 41 Secondly, The Anterior Interosseous is given off deeply, between the heads of the Ulna and Radius;
- 42 It descends close to the Interosseous Ligament, passes under the Pronator Quadratus, behind which it perforates the Ligament, and goes to the back of the wrist.

Answ.

- 43 The Posterior Interesseous has usually a common origin with the anterior;
- 44 About a couple of inches below the Articulation it pierces the Interosseous Ligament, and having given off a Recurrent toward the external Condyle of the Os Humeri, it descends behind the Ligament and is distributed to the Muscles on the back of the Arm, and communicates with the anterior Interosseous and other Arteries.
- of the palm of the Hand, and passes towards the Thumb, lying between the Palmar Fascia and Flexor Tendons of the Fingers;

46 It sends off five Branches, viz. the Ulnaris Profunda,

and four Digital Arteries.

47 The ULNARIS PROFUNDA, which passes deep under the Flexor Tendons to join the Arcus Profundus of the Radial Artery, sends a branch to the inner side of the little Finger.

48 The Four Digital Arteries are given off in succession; each passes between the heads of two neighbouring Metacarpal Bones; it then splits into two, one branch passing along the inside of one finger, the other branch along the outside of the adjacent finger. The first supplies the outside of the Little-finger, and inside of the Ring-finger. The second goes to the outside of the Ring-finger, and inside of the Middle-finger. The third to the outside of the Middle-finger, and inside of the

- Fore-finger. The fourth to the outside of the Index, and inside of the Thumb.
- 49 The Palmar Arch terminates by a branch of communication with the Radial Artery.
- 50 The Radial Artery takes the direction of the Radius, it passes over the Pronator Teres, and at the wrist it lays superficially between the Tendons of the Flexor Carpi, Radialis, and Supinator Longus;
- Recurrent over the outer Condyle, to communicate with the Anastomosing branches of the Brachial; and in its course downward it supplies, by small branches, the various muscles near which it passes.
- 52 At the wrist it gives off the Superficialis Volæ to the Ball of the thumb, and palm of the hand, which often communicates with the Superficial Palmar Arch;
- 53 It then runs backward under the Tendons of the Abductor and Extensors of the Thumb, between the basis of the first bone of the Thumb, and of the Metacarpal Bone of the Fore-finger; it passes into the palm of the hand, where it forms the Arcus Profundus.
- 54 The Arcus Profundus runs under the Tendons of the Flexor Muscles, close to the bones, and joins the communicating branch of the Superficial Arch;
- .55 It gives a branch to the Thumb, and one passes from it between each Metacarpal Bone.

Sect. XLIV. OF THE THORACIC ARTERIES.

SECTION XLIV.

OF THE THORACIC ARTERIES.

Answ.

- 1 The Thoracic Portion of the Aorta gives off the Bronchial, the Æsophageal, and the inferior Intercostal Arteries.
- 2 The Bronchial Arteries are given off very irregularly, but they generally arise from the forepart of the Aorta, there is at least one for each lung, and sometimes more;
- 3 They pass directly to each lung, to the substance of which they are distributed.
- 4. The ÆSOPHAGEAL Arteries, from three to six in number, arise from the forepart of the Aorta, and are distributed to the Æsophagus.
- 5 The INTERCOSTAL Arteries arise in pairs along the back part of the descending Aorta, all the way to the Diaphragm;
- 6 They run transversely over the bodies of the Vertebræ, and supply the Intercostal Muscles, contiguous Pleura, &c.

SECTION XLV.

OF THE ABDOMINAL ARTERIES.

The Abdominal Aorta gives off the Phrenic, the Cæliac, the Superior Mesenteric, the Emulgent, the

Sect. XLV. OF THE ABDOMINAL ARTERIES.

Answ.

Capsular, the Spermatic, the inferior Mesenteric, the Lumbar, and the Sacral Arteries.

- 2 The Phrenic Arteries, two in number arise from the Aorta, between the Crura of the lesser Muscle and the Diaphragm;
- 3 They run along the concave side of the Diaphragm, and are distributed to its fibres, and to the neighbouring parts.
- The Cæliac Artery arises from the forepart of the Aorta, immediately after its passage through the Crura of the Diaphragm, nearly opposite to the junction of the last Dorsal with the first Lumbar Vertebra;
- 5 It soon divides into three great Branches, viz. the Coronary of the Stomach, the Hepatic, and the Splenic Artery.
- 6 The Coronary of the Stomach, the least of the three branches, passes to the left, and having reached the superior Orifice of the Stomach, it returns along the lesser curvature, giving branches which surround the Stomach; it communicates with the Pyloric Artery.
- 7 The Hepatic runs to the upper and inner part of the Pylorus, there giving off first the Pyloric Artery, which is small, and a larger one, the Gastro-Epiploica Dextra, which runs along the right side of the great curvature of the Stomach, having first, at the Pylorus, given off the Duodenal Artery to the Duodenum; the Hepatic Artery then proceeds behind the Gall Ducts toward the Gall-bladder, to which it gives off the Cystic Arteries, and then divides into two

Sect. XLV. OF THE ABDOMINAL ARTERIES.

Answ.

branches, one of which goes to the right, and the other to the left lobe of the Liver.

- Pancreas, toward the Spleen, adhering to the Pancreas, to which it gives off several branches, the Pancreaticæ. Near the extremity of the Pancreas it gives off the Gastro-Epiploica Sinistra to the left portion of the great curvature of the Stomach, it then gives the Vasa Brevia to the great Extremity of the Stomach; and lastly, it divides into four or five considerable branches, which terminate in the Spleen.
- 9 The Superior Mesenteric Artery arises from the forepart of the Aorta, a little below the Cæliac;
- 10 It descends obliquely to the left, at first covered by the Pancreas, it then passes over the Duodenum, and enters between the two Laminæ of the Mesentery. In the rest of its course it takes a sweep obliquely from the left to the right, and terminates at the extremity of the Ilium. By this means it forms a long arch, from which sixteen or eighteen branches proceed, chiefly to the small Intestines. The first and last branches are shorter than the middle ones. These branches join each other by numerous arches. The first considerable Branch is the Colica Dextra, which, passing along the superior part of the Colon, communicates with the inferior Mesenteric. The second principal Branch supplies the last portion of the Ilium and the first of the Colon, and is called, the Ileo-Colica.

Sect. XLV. OF THE ABDOMINAL ARTERIES.

- 11 The Inferior Mesenteric Artery arises from the forepart of the Aorta, about a finger's breadth below the Spermatic Arteries.
- 12 It soon divides into three or four branches, distributed to the large Intestines; the first of which, communicating with the Colica Dextra upon the Colon, is named Colica Sinistra. The lower Branch sends off the Arter's Hæmorrhoidalis Interna to the posterior part of the Rectum.
- 13 The EMULGENT Arteries, one for each Kidney, arise from the sides of the Aorta, immediately under the superior Mesenteric;
- 14 The right lies more backward and is longer than the left, passing behind the Vena Cava; they both lie behind the Emulgent Veins, and enter the substance of the Kidneys behind the Vein.
- 15 The RIGHT CAPSULAR comes, most commonly, from the right Emulgent, and the left from the Aorta, above the Emulgent;
- 16 They pass directly, and are distributed to the Renal Cap-
- 17 The two Spermatic Arteries arise near each other from the forepart of the Aorta, between the Emulgents and inferior Mesenteric;
- branches; in men they pass through the Abdominal Ring, to be distributed to the Testes; while in women they remain within the Abdomen, and are distributed to the Ovaria and Uterus.

Sect. XLVI. OF THE PELVIC ARTERIES.

Answ.

- 19 The Lumbar Arteries arise from the posterior part of the abdominal Aorta, in five or six pairs;
- 20 They are distributed on each side to the loins.
- 21 The Sacral Artery generally arises from the bifutcation of the Aorta;
- 22 It is distributed to the Os Sacrum, contiguous Peritoneum, &c. &c.

SECTION XLVI.

OF THE PELVIC ARTERIES.

- From the termination of the Aorta proceed, opposite the junction of the fourth and fifth Lumbar Vertebræ, the two lliac Arteries, and the Sacral Artery already mentioned.
- 2 The RIGHT PRIMITIVE ILIAC passes first before the origin of the left Iliac Vein, and then descends before the right Iliac Vein.
- 3 The Left descends before and to the outer side of the left Vein.
- 4 Opposite the union of the Ilium and Sacrum, each divides into an internal and an external Iliac Artery.
- 5 The Internal Illiac passes into the Cavity of the Pelvis, a little before the Sacro-Iliac junction; and being directed a little forwards it forms a curve, whose convexity is turned downwards and backwards.

Sect. XLVI. OF THE PELVIC ARTERIES.

- 6 Its Branches are the lesser Iliac, the Glutæal, the Sciatic, the Pudic, the Obturator, and the Umbilical Artery.
- 7 The LESSER ILIAC, or Ileo Lumbalis, is the first branch given off by the internal Iliac, but sometimes proceeds from the Glutæal;
- It passes behind the Psoas, is distributed to the Iliacus Internus, to the Os Iliam, to the Quadratus Lumborum, &c.
- 19 The GLUTEAL, one of its greatest Branches, is the second Branch from the Trunk of the internal Iliac;
- 10 It passes from the Pelvis along with the Sciatic Nerve, through the greater Sacro Isciatic Notch. It is distributed in numerous branches to the Glutæus Maximus and Medius.
- The SCIATIC Artery is the third branch, and next in size to the Gluteal;
- 12 After detaching several branches to the Rectum, &c. it passes obliquely over the Sciatic Nerve, accompanying it through the great Sacro Isciatic Notch, and descending with it along the posterior part of the thigh, and being distributed to the parts adjacent.
- 113 The Public Artery generally arises from one common Trunk with the Eciatic;
- 14 After sending branches to the Bladder, Rectum, &c. it quits the Pelvis through the great Sacro Isciatio Noteh, then passes behind the Spine of the Ischium, and again enters the Pelvis through the lesser Sacro Isciatic Notch; it next runs on the inside of the Tuberosity of the Ischium, and separates into two, an

Sect. XLVI. OF THE PELVIC ARTERIES.

Answ.

inferior, or Perineal Artery; and superior, which is the Artery of the Penis:—the latter runs along the branch of the Ischium and Pubis, to the Symphisis; in this course it sends an Artery to the bulb of the Urethra; and having reached the Symphisis Pubis, it divides into two branches, one the Dorsal, the other the Cavernous Artery of the Penis. The Dorsal runs along the superior groove of the Penis, the Cavernous enters and is distributed within the Corpora Cavernosa.

15 The origin of the OBTURATOR Artery varies, sometimes from the internal Iliac, and sometimes from the lesser Iliac; now and then from the Epigastric, and but rarely from the external Iliac;

16 It passes from the Pelvis at the upper part of the Ligament of the Foramen Ovale, and is distributed to the Pectineus and Triceps.

17 The UMBILICAL Artery, important to the Fœtus, is nearly obliterated in the adult;

18 It ascends on the side of the Bladder, giving branches to it, the Peritoneum, and contiguous parts; it then assumes the form of a Ligament, and passes upward to the Umbilicus.

19 The EXTERNAL ILIAC descends on the Iliac Muscle, as far as Poupart's Ligament.

20 It gives off two branches, namely, the Epigastric and Circumflexa Ilii.

21 The Epigastric arises internally from the External Iliac.
as it passes under the Fallopian Ligament;

- 22 It ascends obliquely behind the Tendon of the Transversalis Abdominis, toward the posterior part of the Rectus, behind which it runs, giving branches to the contiguous parts, and terminates by anastomosing with the internal Mammary. It is important that, in cases of Hernia, the Surgeon should be aware it sometimes gives off the Obturator Artery.
- The CIRCUMPLEXA ILII arises from the outer side of the external Iliac, under the Fallopian Ligament;
- It passes to the inner Labium of the Crista of the Ilium, where it is distributed to the Abdominal Muscles.

SECTION XLVII.

OF THE ARTERIES OF THE LOWER EXTREMITIES.

- I FEMORAL ARTERY is the name given to the external Iliac, immediately after it has passed under the Fallopian Ligament;
- 2 It descends over the brim of the Pelvis, and head of the Os Femoris; it is placed on the inside of the Femoral Vein; in this part of its course it is covered only by the skin, fat and glands; it then descends between the Sartorius, Vastus Internus, and Triceps, being covered for a great part of the way by the former. Below the middle of the Thigh it passes through the tendinous part of the Tri-X.

Vol. II.

Sect. XLVII, ARTERIES OF THE LOWER EXTREMITIES.

Answ.

ceps, then over the inner ridge of the Linea Aspera, and below the Tendon of the Triceps into the Ham, where it forms the Popliteal Artery;

3 In the Groin it sends branches to the Inguinal Glands, &c. one or two to the parts of generation, called, the External Pudic; others to the muscles near the groin, and the Profunda.

4 The Profunda, in size nearly equal to the Femoral, arises about four inches below Poupart's Ligament, from the posterior part of the Femoral Artery;

5 It passes deep betwixt the Adductors and Vastus Internus. It gives off high up, 1st. the Gircumflexa Interna, distributed to the Pectinalis, Triceps, and Obturator; and anastomoses with the Obturator Amery.

edly. The Circumflexa Externa, near the former, distributed to the external and upper part of the Thigh, and anastomosing with the Gluteal.

edly. The Perforantes, usually three in number, sent off lower down, and posteriorly; they perforate the Triceps, and are distributed to the back part of the Thigh.

The POPLITEAL Artery is the name given to the continuation of the Femoral;

7 It gives off two superiorly, called, the Superior Articular, which pass to the upper part of the knee joint; two inferiorly, to the lower part of the knee joint, called, the Inferior Articular; and one or two between these, called, the Middle Articular;

- 8 It divides into two principal branches, namely, the Anterior and Posterior Tibial Arteries.
- Tibia and Fibula, through the Interosseous Ligament, then descends on its forepart, between the Tibialis Anticus and Extensor Digitorum: passes under the common Annular Ligament, and advances on the convex side of the Foot, as far as the interstice, between the first and second Metatarsal Bones.
- As it passes between the Tibia and Fibula, it gives off several small branches; it gives off numerous others as it descends upon the Leg, and over the upper part of the Foot. At its termination it sends a large branch between the heads of the first and second Metatarsal Bones, to join the Posterior Tibial; it also sends several branches over the Metatarsal Bones, and a considerable one to each side of the great Toe.
- Tibialis Posticus, Flexor Digitorum Communis, and Flexor Longus Pollicis; it then runs behind the inner ancle, and passes to the sole of the Foot, through the concavity of the Os Calcis, where it divides into the External and Internal Plantar Arteries;
- 12 It gives branches to the Muscles as it descends, and the Nutrient Artery to the Bone; it also communicates behind the inner Ancle with the Anterior Tibial.
- 43 The External Plantar passes on the concavity of the Os Calcis obliquely under the sole of the Foot, to the

Answ.

base of the fifth Metatarsal Bone; thence it runs across, forming the *Plantar Arch*, toward the great Toe, where it communicates with the large branch of the Anterior Tibial. From the convex side of this *Plantar Arch* branches proceed to the outside of the second Toe, and to both sides of the three last ones, in the same way as the Digital Arteries of the hand are given off.

- 14 The Internal Plantar, having passed beyond the middle of the sole of the Foot, divides sending one branch toward the great Toe, where it communicates with the branch of the Anterior Tibial, and another to the first Phalanges of the other Toes, communicating with the branches of the arch.
- 15 The FIBULAR Artery descends on the back of the Fibula, between the Soleus and Flexor Longus Pollicis, giving Rami in its course; and about the lower third of the Fibula it sends a branch between it and the Tibia to the Integuments of the Tarsus. Between the Astragalus and Tendo Achillis, it forms an arch with the Posterior Tibial, thence running outward above the external Ancle, it communicates with the Anterior Tibial, and sends off several Rami.

Sect. XLVIII. OF THE VEINS IN GENERAL.

SECTION XLVIII.

OF THE VEINS IN GENERAL.

- I The Veins are those Blood Vessels by which the Blood is returned to the Heart from the different parts of the body.
- 2 They are distinguished from Arteries, by being more transparent, less elastic, collapsing when cut across and having no pulsation.
- 3 The Veins arise from the extreme branches of the Arteries, except in the Spleen, Corpora Cavernosa Penis, and Clitoris, where they begin by open mouths in the cells of these parts.
- 4 Their general mode of distribution resembles that of the Arteries;
- 5 They are more numerous and larger;
- 6 Their structure resembles that of the Arteries, but their coats, especially the elastic coat, are thinner.
- 7 The Internal, or Cuticular Coat, forms occasionally semilunar folds, called VALVES;
- 8 These are arranged in pairs, have their concave sides turned towards the Heart, and their straight edges meet when distended;
- 9 They are not found in the Veins of the Head, or Viscera:
- 10 They allow the Blood to flow towards the Heart, but prevent its taking an opposite course.
- 11 Six Trunks return the Blood to the Auricles of the Heart,

Sect. XLIX. THE SUPERIOR CAVA.

Answ.

which the Pulmonary Artery and Aorta had conveyed from the Ventricles.

- 12 The Four Pulmonary Veins return the Blood from the Lungs to the left Auricle. The Superior and the Inferior Cava bring back to the right Auricle that which had been distributed by the Aorta.
- to The Heart has one Vein only, called, the Coronary Vein, which opens into the posterior and inferior part of the right Auricle, very near the Septum Auriculorum.

SECTION XLIX.

THE SUPERIOR CAVA.

- I The Superior Cava arises from the superior part of the right Auricle, where it is surrounded by the Pericardium.
- It ascends a little to the right and backwards, and terminates behind the Cartilage of the first Rib, by dividing into two branches, called, the Subclavian Veins.
- 2 It receives the Vena Azygos, the right internal Mammary Vein, and several lesser branches.
- 4 The Vena Azygos is the Trunk of the Intercostal Veins of the right side, and of the inferior Intercostal of the left.
- 5 It crosses from the left to the right; ascends on the right side of the bodies of the Vertebræ, passes behind and

Sect. L. VEINS OF THE HEAD AND NECK.

Answ.

- above the root of the right Lung, and enters the posterior part of the Vena Cava.
- The RIGHT SUBCLAVIAN receives three vessels, viz. the External Jugular; the Internal Jugular, and the Vertebral.
- 7 The LEFT SUBCLAVIAN, by much the longest, passes before and across the Arteries going to the Head; and receives, besides the same Veins as the right, the Trunk of the left superior Intercostals, and the left internal Mammary.
- The Axillary Vein is a continuation of the Subclavian, and receives the blood of the Veins, which correspond to the branches of the Axillary Artery.

SECTION L.

OF THE VEINS OF THE HEAD AND NECK.

I The External Jugular receives the blood of the following Veins, viz. of the Frontal Vein, from the Fore head: the Angular Vein, from about the inner angle of the Eye; the Temporal Vein, from the Temple; the Auricular Vein, from the Ear; the Lingual Vein from the Tongue; the Occipital Vein, from the Occiput; and the Supra-Humeral Vein, from the Scapula;

2 It runs superficially down the Neck, over the Muscles and passing behind the Clavicle, it terminates generally

Sect. L. VEINS OF THE HEAD AND NECK.

Answ.

in the Subclavian of the same side, but sometimes in the Axillary, and sometimes in the union of these two.

- 3 The Internal Jugular, a large Vein, receives branches from the Fascial and Temporal, but it is chiefly formed by the Sinuses of the Dura Mater.
- ★ These are the Cavernous, the Circular, the Superior and Inferior Petrosal, the Occipital, the Inferior Longitudinal, the Torcular Herophili, and the Superior Longitudinal.
- 5 The Cavernous Sinus is situated on each side of the Sella Tursica, at the Apex of the Petrous portion of the Temporal Bone;
- 6 It receives blood from the great Ophthalmic Veins.
- 7 The CIRCULAR SINUS is situated around the Pituita? Gland.
- The Superior Petrosal Sinus is placed in the groovs of the ridge of each Os Petrosum;
- 9 They receive their blood from the Cavernous and Circular Sinuses.
- 30 The Inferior Petrosal Sinus is situated along the Suture, formed by the Os Petrosum and Os Occipitis;
- 11 It receives blood from the Cavernous and Circular Sinuses.
- 12 The Occipital Sinus is placed in the inferior portion of the Internal Crucial Spine of the Os Occipitis;
- 13 It receives blood from the Cerebellum.
- 14 The Inferior Longitudinal Sinus is situated on the lower edge of the Falx.

Sect. L. VEINS OF THE HEAD AND NECK.

- 15 The TORCULAR HEROPHILI is situated in the junction of the Falx and Tentorium;
- 16 It receives blood from the inferior Longitudinal Sinus, and from the Vena Magna Galeni.
- 17 The Superior Longitudinal Sinus is situated in the furrow of the Spine of the Os Frontis, upper edges of the Parietal bones, and superior portion of the internal Crucial Ridge of the Os Occipitis.
- edge of the Tentorium, in the grooves of the lateral portions of the Crucial Ridge of the Os Occipitis; in those on the inside of the posterior inferior Angle of the Parietal bones; in those of the inside of the Mastoid portions of the Temporal bones; and in those which are situated on each side of the Foramen Magnum of the Occipital bone;
- 19 They receive blood from the superior Longitudinal, Torcular Herophili, Occipital and Petrosal Sinuses;
- 20 They terminate at the Jugular Foramina, where the In-
- 21 These descend by the sides of the Cervical Vertebræ, along the edge of the Longus Colli, behind the Sterno and Omo-Hyoideus, behind the external extremity of the Clavicle;
- 22 They terminate in the Subclavian Veins.
- 23 The Vertebral Vein accompanies the Vertebral Artery through the Foramina of the transverse processes of the Cervical Vertebræ:
- 24 It does not enter the Cranium with the Vertebral Artery;

Sect. LI. VEINS OF THE UPPER EXTREMITIES.

Answ.

but receives blood from the lateral Sinuses through the Foramen Condyloideum Posterius, and Foramen Mastoideum, and from the Vertebral Canal:

25 It terminates in the upper and posterior part of the Subclavian Vein.

SECTION LI.

OF THE VEINS OF THE UPPER EXTREMITIES.

- The Veins of the Extremities are divided into the Deep-seated and the Superficial.
- The Deep-seated Veins regularly accompany the Arteries, and receive the same names;
- 3 Those of the upper Extremity are, one Axillary Vein, two Brachial Veins, two Radial, two Interessial, and two Ulnar Veins.
- 4 The Superficial Veins lie under the skin, and follow a different course;
- 5 Those of the superior Extremity are the Cephalic, and the Basilic.
- 6 The CEPHALIC is situated along the outer and forepart of the Arm and Forearm;
- 7 At the Extremity of the Radius it receives branches from the back part of the Hand, toward the Thumb. Retween the Thumb and the Metacarpus it receives the Cephalica Pollicis, and a little below the bend of the Arm, the Mediana Cephalica;

Sect. I.II. OF THE INFERIOR CAVA.

Answ

- along the outside of the Biceps Muscle; passes between the Pectoralis Major and Deltoid, and terminates in the Axillary Vein.
- 9 The Basilic is situated along the inner and forepart of the Arm and Forearm;
- 10 It receives branches from the back part of the Hand, towards the little Finger; passes over and around the internal part of the Forearm and internal Condyle of the Humerus, above which it receives the Mediana Basilica, and runs along the inner edge of the Biceps;
- 11 It terminates in the Axillary Vein.
- 12 The MEDIANA is situated between the Cephalic and Basilic Veins;
- 13 It divides into two great branches about the middle of the:

 Forearm, namely, the Mediana Cephalica, and Mediana Basilica; which join the Cephalic and Basilica.

 Veins.
- 14 It receives the Vena Profunda, a branch of communication with the deep-seated Veins.

SECTION LII.

OF THE INFERIOR CAVA.

The Inferior Cava, larger than the superior, arises from the inferior part of the right Auricle of the Heart.

Sect. LII. OF THE INFERIOR CAVA.

- 2 It soon pierces the Diaphragm, is placed in a notch at the posterior part of the Liver, descends along the bodies of the Vertebræ to the right of the Aorta; and opposite the junction of the fourth and fifth Vertebræ, it divides into two branches, called, the *Iliac Veins*.
- 3 In this course it receives first, the two Phrenic, or Diaphragmatic Veins; next the four Hepatic Veins; lower down the two Emulgent, and the Spermatic Veins; and lastly, the Lumbar Veins.
- 4 The HERATIC Veins vary in number, they enter the anterior part of the Inferior Cava, just where it passes behind the Liver.
- 5 The EMULGENTS are the Veins of the Kidneys; the left is the longest, passes before the Aorta, and receives the left Spermatic Vein.
- The Spermatic Veins correspond with the Arteries of that name, the right enters the Vena Cava, the left opens into the left Emulgent.
- 7 The Two PRIMITIVE ILIAC Veins follow the distribution of the Iliac Arteries.
- s They divide at the Sacro-Iliac Junction into internal Iliac and external Iliac.
- 9 The Internal Illac receives blood from the Veins which correspond to, and accompany the various branches of, the internal Iliac Artery.
- 10 The EXTERNAL ILIAC accompanies the Artery, and is situated at its inner side; it receives the Veins of the lower Extremities.

Sect. LIII. VEINS OF THE LOWER EXTREMITIES.

SECTION LIII.

OF THE VEINS OF THE LOWER EXTREMITIES.

Answ.

- 1 The Veins of the Lower Extremities, like those of the upper, have a deep-scated and a superficial set.
- 2 The Deep-seated are, the Femoral Vein, Popliteal Vein, two posterior Tibial Veins, two anterior Tibial Veins, and two Interossial Veins.
- 3 The Superficial are, the Saphena Major, and Saphena Minor.
- 4 The Saphena Major is situated on the inner part of the Foot, Knee and Thigh;
- 5 It receives branches from the upper part of the back of the Foot, towards the great Toe; runs over the Maleolus Internus, along the inner part of the Tibia, just behind the internal Condyle of the Femur, and follows the direction of the Sartorius up the Thigh, receiving branches in its course;
- o It terminates in the Crural Vein, a little below Poupart's Ligament.
- 7 The Saphena Minor begins on the outside of the Foot, ascends on the same side of the Tendo Achillis and Gastrocnemius, and enters the Ham;
- It terminates in the upper part of the Popliteal Vein.

Sect. LIV. OF THE VENA PORTÆ.

SECTION LIV.

OF THE VENA PORTÆ.

Answ.

- 1 The Vena Porte is a Vein of great size, peculiar to the Liver, and which has two sets of branches;
- 2 One set called collectively, Vena Portæ Abdominalis, is distributed over the Stomach, Intestines, Spleen, and Pancreas, accompanying the Arteries of these parts, and receives their Blood.
- The other set, called collectively, the Vena Portæ Hepatica, is ramified through the substance of the Liver, secretes the bile, and terminates in the Hepatic Veins.
- The Trunk of the Vena Portæ, is situated partly in the transverse fissure of the Liver, where it is called, the Sinus of the Vena Portæ, and partly it is contained in Glisson's Capsule;
- The state of the s
- The MESENTERICA MAJOR, or Superior, receives blood from the Veins corresponding to the superior Mesenteric Artery.
- The Splenica receives its blood from the Spleen, and from a branch of the Coronary Vein of the Stomach, the Pancreatic Veins, and the Gastro-Epiploica Sianistra.

Sect. LV. OF THE ABSORBENT SYSTEM.

Answ

- blood from the inferior Mesenteric, and some branches of the Cæliac Arteries;
 - It also receives smaller Veins, viz. the Cystic, the Pyloric, and the Duodenal Veins; as also the Gastrice Dextra, and the Coronary Vein of the Stomach.

SECTION LV.

OF THE ABSORBENT SYSTEM IN GENERAL.

- The Absorbents are a numerous set of minute transparent vessels, distinct from the blood vessels, which take up the nutritive part of our food, and the various fluids and solids of the body, to make way for the deposit of fresh matter.
- 2 They are divided into Lacteals and Lymphatics.
- 3 This distinction has arisen only from the colour of their contents,—the Lacteals contain a milk-like fluid, the chyle, they are the absorbents of the small Intestines; all the other absorbents of the body are called Lymphalics, containing Lymph.
- They begin by minute open mouths, first from all the internal Cavities; secondly, from the Cellular Membrane, and every interstice; thirdly, from the Ducts and Glands; fourthly, from the surface of the Skin, Stomach, Intestines, &c.

Sect. LV. OF THE ABSORBENT SYSTEM.

Answ.

- 5 They follow the general course of the Veins: in the Limbs, there is a Deep-seated and a Superficial set.
- They terminate by two Trunks behind the middle of each Clavicle, in the Subclavian Vein, near the angle formed by it and the internal Jugular.
- 7 The left is the principal Trunk, and is called, the Tho-RACIC DUCT; it receives all the absorbents of the body, except those of the right arm and right side of the head, which form the right Trunk.
- * They are very thin and transparent, but remarkably dense, and stronger than the red veins.
- 9 They have a muscular and an cuticular Coat.
- 10 The cuticular Coat is the most internal, and forms numerous pairs of valves, in every absorbent vessel.
- sorbent system, are small glandular bodies, through which the absorbents convey their contents before they terminate in the common Trunks.
 - They are found in clusters in various parts of the body, as just below the Occiput, under the Ears and Jaw, along the side of the Neck, behind the Clavicle, in the Axilla, and two or three near the Ellow; in the Thorax, the Bronchial Glands, at the root of the Lungs; in the Abdomen, called Mesenteric Glands, belonging to the Lacteals; in the Loins and Pelvis, in the Inguen; and two or three in the Ham.
- Inferentia, they are more numerous than those which

Sect. LVI. LYMPHATICS OF THE HEAD AND NECK.

Answ.

pass out of the Gland, and are called, Vasa Effe-

These Glands appear to be of cellular structure, and not composed of convoluted absorbents.

SECTION LVI.

OF THE LYMPHATICS OF THE HEAD AND NECK.

- The LYMPHATICS OF THE HEAD AND NECK are divided into the Facial, Temporal, Occipital, and Thyroideal Lymphatics.
- The Facial accompany the Trunk and Branches of the Facial blood vessels, and pass through small glands situated in their course.
- The Temporal accompany the Temporal blood vessels, and pass through glands at the root of the Zygomatic Process.
- The Occipital accompany the Occipital blood vessels, pass through glands behind the Mastoid process, and descend with the others along the external and internal Jugular Veins, to join the Lymphatics of the upper Extremities.
- 5 The THYROIDEAL descend on each side the Traches, through the Cervical Glands, to the commencement of the Thoracic Duct.

Sect. LVII. LYMPHATICS OF THE UPP. EXTREMITIES.

Answ.

6 Lymphatics have never been demonstrated in the Brain, but their existence is not doubted.

SECTION LVIL

OF THE LYMPHATICS OF THE UPPER EXTRE-MITIES.

- 1 The Superficial Lymphatics of the upper Extremity follow the course of the Cephalic and Basilic Veins; these accompanying the Basilic enter two or three glands just above the internal Condyle of the Os Humeri.
- * The Deep-seated accompany the Arteries, there being three or four, or more, Lymphatic Trunks to each Artery.
- 3 They all terminate in the Axillary Lymphatic Trunk;
- 4 This opens into the Thoracic Duct on the left side.
- 5 The right Axillary Lymphatic Trunk terminates by a second Trunk common to it, and the Lymphatics of the right side of the Head.

Sect. LVIII. LYMPHATICS OF THE LOW. EXTREMITIES.

SECTION LVIII.

OF THE LYMPHATICS OF THE LOWER EXTRE-MITIES.

Answ.

- 1 The Superficial Lymphatics of the lower Extremities follow the course of the Saphena Major and Minor Veins. Those accompanying the Saphena Minor, enter two or three glands placed in the Ham.
- * The Deep-seated accompany the Arteries; several Lym-phatic Trunks are found with each Artery.

SECTION LIX.

OF THE LYMPHATICS OF THE TRUNK.

of Generation, pass through the Inguinal Glands, then under Poupart's Ligament to glands situated at the brim of the Pelvis; those from the Testicles pass along the Spermatic Chord to the Lumbar Glands. those from the Cavity of the Pelvis generally proceed along the internal Iliac Artery, and a third set ascends upon the Psoas Magnus. At the posterior part of the Pelvis they collect toward the right side, forming a Plexus in the right Lumbar Region, and at the third

Sect. LIX. LYMPHATICS OF THE TRUNK.

Answ.

Lumbar Vertebra they unite, and being soon joined by the Lacteals, form the Receptaculum Chyli.

- ceed through glands to a considerable vessel near the Aorta; those from the Spleen pass along with its Artery; those from the Pancreas join the Lymphatics of the Spleen; those from the Stomach in part join those of the Spleen; others follow the course of the Coronary Artery, being joined by vessels from the Liver; those of the Liver, either ascend its broad Ligament, or join the deep-seated vessels, or ascend in trunks behind the Sternum. The Lymphatics of the Intestines are called Lacteals, they run through glands placed in the Mesentery, to the Receptaculum Chyli.
- deep-seated, and passing through the Bronchial Glands, they partly join the Thoracic Duct behind the bifurcation of the Trachea, while some of those from the right Lung ascend in a trunk before the superior Cava, and terminate in the great Lymphatic Vessel which opens between the right Subclavian and Jugular Vein: and others from the left, passing behind the arch of the Aorta, terminate near the end of the Thoracic Duct. The Lymphatics of the Heart accompany the Coronary Vessels, and those of the left side terminate with the last mentioned Lympatics of the Lungs, while those of the right terminate between the right Subclavian and Jugular Veins.

Sect. LX. OF THE LACTEAL SAC AND DUCT.

SECTION LX.

OF THE LACTEAL SAC AND DUCK.

Answ.

- 1 The LACTEAL SAC is situated on the body of the first Lumbar Vertebra, behind the right Crus of the Diaphragm, and above the right Renal Artery;
- 2 It is irregularly oval, diminishing towards its upper part, being about an inch in length, and a third of an inch in breadth.
- 3 From the upper part proceeds the LACTEAL, or THORACIC DUCT.
- 4. This passes between the Crura of the Diaphragm and beneath the right side of the Aorta, and ascends between that vessel and the Vena Azygos, to the fifth Dorsal Vertebra, where that Vein, in its passage to join the Cava, covers it. The Duct then passes behind the Esophagus and the curvature of the Aorta, to the left side, till, behind the left Carotid Artery, and on that side of the Esophagus, it ascends to the first or second Dorsal Vertebra, and, leaving the Carotid, makes a circular turn and divides: uniting again almost immediately, it descends,
- 6 And terminates behind the internal Jugular Vein, in the upper part of the Subclavian Vein.
- Its opening into the Vein is guarded by two Semilunar:
 Valves.

Sect. LXI. OF THE NERVES IN GENERAL.

NEUROLOGY.

SECTION LXI.

OF THE NERVES IN GENERAL.

Answ.

The Nerves are long, white firm cords, which ramify, after the manner of the blood vessels, to be distributed to all parts of the body.

2 They arise from the Brain, Medulla Oblongata, and Me-

dulla Spinalis.

- 3 They in general follow the course and distribution of the Arteries, arising in pairs, and dividing into Branches and Ramifications.
- They anastomose; and in some parts their mutual communications are numerous, forming a Plexus; at others a knot, called Ganglion, is found in the course of a Nerve, from which numerous branches arise.
- The Nerves consist of Fasciculi, or bundles of distinct longitudinal fibres, closely connected together by cellular substance.
- Their membranous coverings are said to be continuations of those which envelop the Brain and Spinal Marrow;

Sect. LXI. OF THE NERVES IN GENERAL.

A asw

these are distinct at their origin, but afterwards a firm cellular texture only appears to surround them.

- 7 They are well supplied with blood vessels.
- The Ganglions are of a redish grey colour, of firm consistence, and formed by a close intertexture of filaments.
- 9 The Nerves are divided into Cerebral, of which there are ten pairs; and Spinal, of which there are thirty pairs; besides these the Grand Sympathetic Nerve.
- 10 The Cerebral Nerves pass out through various holes in the basis of the Cranium.
- 11 The Spinal Nerves through the Lateral Foramina of the Vertebræ, and the Anterior Foramina of the Os Sacrum.
- The Ten Cervical Pairs of Nerves are; the First Pair, or Olfactory Nerves; the Second Pair, or Optic Nerves; the Third Pair, or Motores Oculorum; the Fourth Pair, or Pathetici; the Fifth Pair, or Trigemini; the Sixth Pair, or Motores Externi; the Seventh Pair, or Auditory Nerve; the Eighth Pair, or Par Vagum; the Ninth Pair, or Lingual Nerves; and the Tenth Pair, or Suboccipital Nerves.
- 13 The Spinal Nerves are divided into Gervical, Dorsal, Lumbar, and Sacral.

Sect. LXII. OF THE CEREBRAL NERVES.

SECTION LXII.

OF THE CEREBRAL NERVES.

FIRST PAIR.

Answ.

- 1 The OLFACTORY Nerves arise from the Corpora Striata,
- 2 They pass forward on each side of the Crista Galli, becoming gradually larger and softer, and reach the Os Ethmoides without any communication between them.
- They split into a great number of filaments, and pass our of the Cranium through the holes of the Cribriforn Plate of the Ethmoid Bone;
- 4 These are ramified on the Membrane lining the Septuma. Narium, and the rest of the Cavity of the Nose.
- 5 They communicate by several filaments, with the Oplithalmic and superior Maxillary Nerves.

SECOND PAIR.

- 6 The Optic Nerves, the largest of the Cervical Pairs, arise from the Thalami Nervorum Opticorum;
- 7 They first pass outward, then approach each other, unitable before the Sella Tursica, and again separate;
- They quit the Cranium through the Foramina Optica.
- 9 They pass to and enter the Globe of the Eye, in order to form the Retina.

Sect. LXII. OF THE CEREBRAL NERVES.

THIRD PAIR.

Answ

- 10 The Motores Oculorum arise from the Crura Cerebri, just before the anterior edge of Pons Varolii;
- Posterior Clynoid process, and run along the upper part of the Cavernous Sinus.
- 12 They pass out of the Cranium through the Foramen Lacerum Orbitale Superius.
- 13 Each sends, 1st. a branch to the Rectus Superior, which gives a ramus to the Levator Palpebræ Superioris.
 - 2dly. A branch to the Rectus Internus.
 - 3dly. A branch to the Rectus Inferior.
 - 4thly. The longest branch to the Obliquus Inferior.
 - 5thly. A branch to the Lenticular Ganglion.
- ments, forming the Ciliary Plexus; they surround the Optic Nerve, perforate the Sclerotic Coat, and run between it and the Choroid as far as the Iris, to which they are distributed.

FOURTH PAIR.

- 15 The Pathetici, the smallest pair, arise behind the Nares.
- They pass on each side to the edge of the Tentorium, within which they are concealed, and along the upper part of the Cavernous Sinus.

Sect. LXII. OF THE CEREBRAL VEINS.

Answ.

17 They pass out of the Cranium through the Foramen Lacerum Orbitale Inferius.

15 They terminate in the Obliquus Superior.

FIFTH PAIR.

The Trigemini arise from the sides of the Pons Varolii, by numerous distinct filaments.

20 They pass toward the point of the Os Petrosum, where each perforates the Dura Mater, a little below the commencement of the Tentorium, and forms a flat Semilunar Ganglion.

21 From its Semilumar Ganglion each give, off three great Branches, namely, the First, or Ophthalmic; the Second, or Superior Maxillary; the Third, or Inferior Maxillary.

22 The Ophthalmic Branch passes through the Foramen Lacerum Orbitale Superius.

The Superior Maxillary passes through the Foramen Rotundum to the upper Jaw.

24 The Inferior Maxillary passes through the Foramen Ovale toward the lower Jaw.

25 The Outsthalmic sends off, 1st. a Frontal branch through the Superciliary Notch to the Forehead. 2dly. A Nasal branch towards the inner Canthus, to the Lachrymal Sac, and parts adjacent, sending branches through the internal Orbitar Foramina, one of which takes a circuitous course to the tip of the Nose. \$dly. A Lachrymal branch to the Lachrymal Gland.

Sect. LXII. OF THE CEREBRAL NERVES.

Answ.

4thly. Some branches of communication to the Lenticular Ganglion, and to the fourth pair.

- 26 The Superior Maxillary sends off, 1st. The Pterigoid branch through the Pterigoid Foramen, to join the Porteo Dura of the seventh pair. 2dly. The Spino-Palatine to the Nose, through the Foramen of that name. 3dly. The Palatina, down the Palatine Foramen to the Palate. 4thly. The Infra-Orbitar through the Canal of that name, to the Cheek and upper Lip. 5thly. Filaments to the Teeth of the upper Jaw.
- branch, 2dly. A branch to the Cheek. 3dly. A Lingual branch; this is the true Gustatory Nerve, its branches terminating in the Papillæ of the Tongue 4thly. The Dental branch, which is the continuation of this Nerve, it enters the Canal of the lower Jaw, is distributed to the Teeth, and comes out at the Chin through the mental hole.

SIXTH PAIR.

- 28 The Motores Exteri arise between the Pons Varolii and the Corpora Olivaria.
- 29 Advancing to the Dura Mater, they perforate it on one side of the junction of the Sphænoid and Occipital Bones. They then run through the Cavernous Sinus by the side of the Carotid Arteries, to which they closely adhere, and also communicate with a branch of the fifth pair; they likewise send backward a fila-

Sect. LXII. OF THE CEREBRAL NERVES.

Answ

ment along the Carotid Artery, accompanying it in its Canal, and joining the Great Sympathetic.

- 30 They finally quit the Cranium through the Foramen Lacerum Orbitale Superius.
- 31 Each is distributed wholly to the Rectus Externus Oculi.

SEVENTH PAIR.

- 32 The Auditory Nerves arise from the lateral and posterior part of the Pons Varolii.
- 33 They pass into the Meatus Auditorius Internus of the Ear on each side.
- 34 Each consists of two portions, namely, the Portio Mollis, and Portio Dura.
- 35 The Portio Dura, small and firm, is placed anteriorly; the Portio Dura, larger and softer, is situated more posteriorly.
- 36 The Portio Mollis enters the organ of hearing at the basis of the Cochlea, and inner side of the Vestibulum, and is alone distributed to the Labyrinth.
- 37 The Portio Dura passes from the Cranium through the Fallopian Aqueduct, and Stylo-Mastoid Foramen;
- rior surface of the Os Petrosum, to join the Pterigoid Nerve, then one to the Stapideus, and as it goes out another, which passing through the Tympanum, is called, Chorda Tympani, and joins the Lingual branch of the inferior Maxillary Nerve.
- 19 On quitting the Stylo-Mastoid Foramen, the Portio Dura

. Sect. LXII. OF THE CEREBRAL NERVES.

. Answ.

forms a Plexus, whose branches are widely distributed over the side of the Head and Neck, to the Temple, to the Eyelids, Cheeks, Nose, Lips, Chin, Head, and Neck, forming what has been called, the Pes Anserinus.

:40 It freely communicates with the three branches of the fifth pair, and with the Cervical Nerves.

EIGHTH PAIR.

- *11 The PAR VAGUM arise from the Corpora Olivaria laterally.
- At its commencement it consists of two separate portions, the first called, the Glosso-Pharyngeal Nerve; and the second, the true Par Vagum.
- May run towards the Jugular Foramen, before the extremity of the Lateral Sinus, from which the Nerve on each side is separated by two small bony prominences, and a membranous Septum. Here the Glosso-Pharyngeal Nerve is situated before the Par Vagum, and separated from it by a thin membranous Septum.
- 44 It is joined by the Nervus Accessorius, in its passage through the Jugular Foramen.
- Muscles at the back of the Neck.
- 46 The GLOSSO-PHARYNGEAL Nerve is distributed to the

Sect. LXII. OF THE CEREBRAL VEINS.

Answ.

Tensils, Pharynx and Tongue; and sends branches of communication to the fifth, seventh and ninth pairs.

- 47 The PAR VAGUM passes before and adheres to the ninth pair, and to the Superior Cervical Ganglion of the Great Sympathetic, it descends along the Neck by the side of the Carotid Artery, behind the internal Jugular Vein, and in company with the Great Sympathetic Nerve;
- The Pharyngeal to the Pharynx. 3dly. The Larynzeal to the Pharynx and Thyroid Gland. 4thly. Branches to the Cardiac Plexus, and others of communication with the Great Sympathetic, the Recurrent, and the ninth pair;
- 49 It enters the Thorax, passing before the Subclavian Artery and Vein on the right side; but on the left behind the Subclavian Vein, and before the arch of the Aorta:
- 50 It then gives off the Recurrent.
- the Subclavian Artery on the right side, and the Aorta on the left: they then run behind these vessels, ascending to the posterior part of the Larynx to be distributed to its Muscles, and communicate with the Great Sympathetic, the Cardiac Plexus, &c.
- form the Cardiac Plexus; branches to the Lungs, forming the Pulmonary Plexuses; they then pass to

Sect. LXII. OF THE CEREBRAL VEINS.

Answ.

the Œsophagus, descend behind it to the Stomach, forming the Œsophageal Pierus, and especially distributed to the Stomach, forming the Coronary Plexus.

NINTH PAIR.

- 53 The LINGUAL NERVES arise between the Corpora Pyramidalia and Olivaria, by several filaments, which uniting generally form two small chords.
- 54 They pierce the Dura Mater, and pass out of the Ctanium by the Anterior Condyloid Foramina.
- 55 After quitting the Cranium each is united to the Trunk of the eighth pair, to the Superior Cervical Ganglion, and, by a branch of communication, to the tentla pair;
- 56 It passes before the large Ganglion of the Great Sympathetic, runs between the internal Jugular Vein and Carotid Artery, and then to the Tongue, to the Muscles of which it is distributed.
- branch, which descends along with the Carotid Artery, called, Descendens Nossi;
- This joins branches from the first, second, and third Cervical, and is distributed with them to the Muscles at the forepart of the Neck.

Sect. LXIII. VERTEBRAL NERVES IN GENERAL.

TENTH PAIR.

. Answ.

The Suboccipital Nerves arise at the extremity of the Medulla Oblongata, and beginning of the Spinal Marrow, by small filaments;

Mater where the Vertebral Arteries enter, and running in its duplicature, emerge under the edge of the Occipital Foramen.

ninth pairs, to the Superior Cervical Ganglion, and to the first Cervical pair; and are then distributed to the extensor Muscles of the Head and Occiput.

SECTION LXIII.

OF THE VERTEBRAL NERVES IN GENERAL.

- Each VERTEBRAL NERVE arises from the Medulla Spinalis by two flat Fasciculi of Nervous Filaments, one anterior, the other posterior.
- The two Fasciculi uniting, perforate the Dura Mater, and pass through the Lateral Foramina of the Vertebral Column;
- Trunk is produced; from which immediately one branch passes backwards and one forwards.
- There are thirty pairs of Vertebral Nerves, viz.

Sect. LXIV. OF THE CERVICAL NERVES.

Answ.

5 Seven Cervical, twelve Dorsal, five Lumbar, and six Sacral.

SECTION LXIV.

OF THE CERVICAL NERVES.

FIRST PAIR.

- 1 The FIRST CERVICAL PAIR pass out between the first and second Cervical Vertebræ.
- Note Tits Anterior Branch communicates with the Superior Cervical Ganglion, and with the Suboccipital Nerve; it sends branches to join the Descendens Noni, and the second Cervical Pair, and others to the Muscles at the anterior part of the Neck.
- Let posterior branch, the most considerable, is distributed to the Muscles at the upper and back part of the Neck?

SECOND. PAIR.

- 4 The second Cervical Pair pass out between the second and third Cervical Vertebræ.
- 5 Its anterior branch communicates with the second and fourth Cervical Pairs, the Great Sympathetic, the Descendens Noni, and often concurs in the formation of the Phrenic Nerve.

Wol. II.

Sect. LXIV. OF THE CERVICAL NERVES.

Answ.

6 Its posterior branch follows a nearly similar course to that of the first pair, with which it anastomoses, as well as with the Portio Dura of the seventh.

THIRD PAIR.

- 7 The THIRD CERVICAL PAIR pass out between the third and fourth Cervical Vertebræ.
- Sympathetic, fifth Cervical, and sends a large branch to the Phrenic.
- 9 Its posterior branch is distributed to the back of the Neck, and with those already described forms a Plexus of Nerves which supply the back of the Neck and Head.

DIAPHRAGMATIC NERVE.

- 10 The DIAPHRAGMATIC, or PHRENIC NERVE, is formed by branches from several of the Cervical Nerves, of these the most constant and the largest is from the third Cervical;
- It runs before the Scalinus, enters the Thorax behind the anterior extremity of the Clavicle, then receiving a filament from the First Dorsal, and communicating with the Sympathetic, it passes obliquely before the Subclavian Artery, and on one side the Far Vagum, near the origin of the Recurrent. Within the Thorax it passes before the root of the Lung, along the side of

Sect. LXIV. OF THE CERVICAL NERVES.

Answ_

- the Pericardium, then running backward enters the Diaphragm.
- 12 The right Nerve runs straighter, and lies more anteriorly; the left lies backward toward the Aorta, then bending over the Pericardium, where it covers the Apex of the Heart it is longer than the right.
- 18 It terminates by numerous ramifications on the greater Muscle of the Diaphragm, and by some filaments on the lesser, where it communicates with the Sympathetic and contiguous Abdominal Plexuses.

FOURTH, FIFTH, SIXTH, AND SEVENTH PAIRS.

- PAIRS, follow a similar course and distribution; they pass from the Spine between their respective Vertebræ.
- 15 Their posterior Branches are all small, and distributed to the posterior part of the Neck, and upper part of the Back.
- These anterior Branches are considerable, they send small branches of communication to the Great Sympathetic, a few to the neighbouring Muscles, Glands, &c. &c. they then unite, and, together with the first Dorsal, form the Axielary Plexus.

Sect. LXVI. OF THE BRACHIAL NERVES.

SECTION LXV.

OF THE BRACHIAL NERVES.

Answ

- 1 The Axillary Plexus is formed by the four inferior Cervical and first Dorsal Nerves;
- 2 It consists at its origin of three distinct portions, viz. a common Trunk formed by the union of the fourth and fifth Cervical; below a common Trunk, formed by the union of the last Cervical and first Dorsal, and between these the sixth Cervical Nerve alone; these soon unite and form a bundle of Nerves so interwoven as not to be unravelled, which pass under the Clavicle with the Artery and Vein into the Axilla.
- 3 From this Axillary Plexus are given off the Brachial Nerves:
- 4 It first gives off the Scapularis and the Thoracic Nerves, and then divides into six large Nerves, viz. the Mussculo-Cutaneus, the Median, the Cubital, the Internal Cutaneus, the Radial, and the Axillary.
- The Musculo Cutaneus, Median, Cubital and Internal Cutaneus arise anteriorly, the Radial and Axillary posteriorly.
- The SCAPULARIS arises from the upper and back part of the Plexus;
- 7 It runs to the Coracoid Notch, passes over it, and is distributed to the Supra and Infra Spinatus, and Teres Minor.
- The THORACICI, three in number, arise from the upper part of the Plexus.

Sect. LXVI. OF THE BRACHIAL NERVES.

Answ.

- 9 They are distributed to the Pectoralis Major, and Minor, Serratus Major Anticus, and Latissimus Dorsi.
- of the Coraco Brachialis, then between the Biceps and Brachialis, to these it gives branches, and is distributed to the Skin at the outer part of the Forearm and back of the Hand.
- Plexus, it accompanies the Brachial Artery; in the Forearm it passes deep-seated, between the Flexor Sublimis and Profundus, under the Ligamentum Annulare Carpi to the palm of the Hand, where it divides into branches, viz. two to the Thumb,—two to the Fore-finger,—two to the Middle-finger,—and one to the Ring-finger, after communicating with a branch of the Cubital.
- The Cubital descends along the inner part of the Arm, passes in a groove between the inner Condyle of the Humerus, and the Olecranon perforates the Flexor Carpi Ulnaris, descends over the Ligamentum Annulare Carpi to the palm of the Hand, where it sends off one branch to the Ring-finger, two to the Little-finger, and a branch of communication to the Median.
- The Internal Cutaneus is the smallest of the Brachial Nerves, it passes superficially along the inside of the Arm, and is distributed to the Integuments at the inner and forepart of the Fore-arm.
- 14 The RADIAL runs backward round the Os Humeri, covered by the Triceps, to which it gives branches to

Sect. LXVI. OF THE DORSAL NERVES.

Answ.

the outside of the Elbow; at the bend of the Arm it descends between the Brachialis and Supinator Longus, to which and to the contiguous Extensors and Supinators it gives rami. It here divides into a Superficial and a Profound Branch. The Superficial Branch accompanies the Radial Artery, and at the lower part of the Radius it sends rami to the convex parts of the Thumb and three adjacent Fingers. The Profound Branch passes between the upper extremity of the Radius and Supinator Brevis, in its passage supplying the neighbouring muscles. It is then lost in the Extensor Communis and Muscles of the Carpus and Thumb, after having given a Ramus to the Musculo-Cutaneus Nerve.

between the Teres Major and Minor, and behind the head of the Os Flumeri, round the neck of which it turns, passing between the articulation and the upperend of the long head of the Triceps to the Deltoid, under which it passes and ramifies, supplying the adjacent muscles and the joint.

SECTION LXVI.

OF THE DORSAL NERVES.

- 1 There are Twelve Pairs of Dorsal Nerves.
- 2 They arise from the Spinal Marrow in the same way asthe Cervical, and like them pass out through the

Sect. LXVII. OF THE LUMBAR NERVES.

Answ.

holes formed by the junction of the Vertebral Notches;

- 3 Each now presents a gangliform enlargement, from which a small posterior Branch and a large anterior Branch arise.
- 4 The posterior Branches are distributed to the Muscles and Integuments of the Back.
- 5 The anterior Branches send each two branches to the Thoracic Ganglia of the Great Sympathetic; they then follow the course and distribution of the Intercostal Arteries, and are called, the Intercostal Nerves.
- The First Dorsal Pair, after communicating with the Great Sympathetic, and sending off its posterior and a small intercostal branch, concurs in the formation of the Axillary Plexus.
- The Second and Third Intercostals send branches to form the Intercosto-Humeral Nerves, which pass into the Axilla, and are distributed to the Integuments on the inside of the upper Arm.
- The Five Inferior Intercostals also supply the Muscles and Integuments of the Abdomen.

SECTION LXVII.

OF THE LUMBAR NERVES.

- There are Five Pairs of LUMBAR NERVES.
- 2 They arise, form each a Ganglion after leaving the Spine, and send off an anterior and a posterior branch in the

Sect. LXVII. OF THE LUMBAR NERVES.

AMSW.

same manner as has been described of the Cervical and Dorsal Nerves; they send branches backward to the Vertebral Muscles, and communicate with each other and with the Sympathetic; by their mutual communication they form the Lumbar Plexus.

FIRST PAIR.

The FIRST PAIR is distributed in three branches; one to the abdominal Muscles, around the Crista of the Ilium; the other passes to the Pubis and Scrotum; and the third to the Groin, where it contributes to form the Crural Nerve.

SECOND PAIR.

4 The SECOND PAIR contribute largely to the Lumbar Plexus, and concurs in the formation of the Crural and Obturator Nerves.

THIRD PAIR.

5 The THIRD PAIR contributes to form the Crural and Obturator Nerves, and gives branches to the neighbouring Muscles.

FOURTH PAIR:

The Fourth Pair sends a branch which, joining onefrom the Third, and one from the Second Pair, forms the Obturator. At the same place it completes the

Sect. LXVIII. OF THE SACRAL NERVES.

Ausw.

formation of the Crural Nerve. Its remaining portion joins the Fifth Pair.

FIFTH PAIR.

The FIFTH PAIR of the Lumbar Nerves descends on the Sacro-iliac-Symphysis, enters the Pelvis, and receiving a branch from the Fourth Lumbar, joins the Sacral Nerves to produce the Sciatic Plexus.

OBTURATOR NERVE.

- * The OBTURATOR NERVE is formed by branches from the Second, Third and Fourth Pairs of Lumbar Nerves;
- It passes from the Pelvis at the upper part of the Obturator tor Foramen, supplying in its course the Obturator Muscles and Pectineus. It then divides into three chief branches to the portions of the Triceps, and sends Rami between them to the Gracilis.

SECTION LXVIII.

OF THE SACRAL NERVES.

- I There are generally Six Pairs of SACRAL NERVES.
- 2 Their posterior small branches pass out by the Posterior Sacral Foramina, the anterior branches of the four Superior pass through the Anterior Sacral Foramina, the two Inferior through the lateral Notches at the extremity of that Bone, and in the Os Coccigis.

Sect. LXIX OF THE CRURAL AND SCIATIC NERVES.

Answ.

- 3 The first pair are very large, the inferior ones gradually diminish, the last is very small.
- 4 The three superior, by their junction with the fourth and fifth Lumbar Pairs, form the Scialic Plexus.
- 5 From the Plexus, but more especially from the second pair, a branch goes to the Vesiculæ Seminalis, Prostate, Uterus, Fallopian Tubes: another chiefly from the fourth pair, has a similar distribution, and goes also to the Rectum and Bladder—A third branch, the Pudic, chiefly from the third runs on the inside of the Ischium to the Corpus Cavernosum, the Muscles, parts of Generation, and Sphincter Ani. From the extremity of the Plexus, one branch, the Glutæal, goes to the Glutæus Medius, and Minimus.
- of the Sacrum and Ligament of the Os Coccigis, is distributed chiefly to the Muscles of the Anus, and neighbouring Integuments.—The LAST PAIR running in a direct line from the extremity of the Sacral Canal, is distributed to the Anus, Integuments, &c.

SECTION LXIX.

OF THE CRURAL AND SCIATIC NERVES.

CRURAL NERVE.

The CRURAL NERVE is formed by the union of the three or four Superior Lumbar Nerves;

Sect. LXIX. OF THE CRURAL AND SCIATIC NERVES.

Answ.

- 2 It passes under Poupart's Ligament to the Groin;
- 3 It is situated anterior to the blood vessels.
- 4 In the Groin it divides into numerous branches, some superficial, which go to the Integuments; others profound, which are distributed to the neighbouring Muscles; one branch, larger and longer than the rest, accompanies the Saphina Vein to the Ancle, and in its course on the Thigh, accompanies the Femoral Artery.

SCIATIC NERVE:

- 5 The SCIATIC NERVE, the largest in the human body, is formed by the plexiform union of the last Lumbar, and first four Sacral Pairs;
- Fit passes out of the Pelvis by the Great Ischiatic Notch, proceeds betwixt the Great Trochanter and Tuberosity of the Ischium, descends on the back part of the Thigh to the Ham, where it receives the name of POPLITEAL NERVE.
- 7 In this course it gives branches to the Muscles and Integuments.
- * The Populteal Nerve is situated between the Hamstrings, and divides into an External, or Fibular Nerve, and an Internal, or Tibial Nerve, which gradually separate and pass behind the Condyles of the Os Femoris, and between the heads of the Gastrochimii.
- 9 The TIBIAL NERVE descends behind the Popliteal Muscle, by the side of the Plantaris, between the Gastroc-

Sect. LXIX. OF THE CRURAL AND SCIATIC NERVES.

Answ.

nimii; it then pierces the head of the Soleus, and runs between that Muscle and the great Flexors of the Toes, near to the inner Ancle.

- Muscles and Integuments contiguous to its course. It seeds also a greater Branch from its upper part, which gives one filament to the Tibialis Posticus, and another perforating the Interrosseus Ligament to the upper part of the Tibialis Anticus Muscles; it then sends a long Ramus down the back of the leg, between the Integuments and Gastrochimius, by the side of the Saphina Externa; the Trunk then passes behind the inner Ancle, through an Annular Ligament, to the sole of the Foot, when it divides into the internal and external Plantar Nerves, which accompany the Arteries of the same name.
- 11 The Internal Plantar Nerve is the largest, it runs first along the inner side of the sole of the Foot, giving filaments to the Adductor Pollicis, Flexor Brevis, Digitorum, and Massa Carnea Sylvii, it then divides into four branches, which are distributed to the Toes, after the manner of the Median Nerve in the Hand.
- 12 The External Plantar Nerve passes along the outer edge of the Foot, and divides into two branches, the first branch runs between the two last Toes, and divides to their sides; the second branch goes to the inferior external side of the little Toe;
- 13 The Fibular Nerve runs forward round the head of the Fibula, and divides into several Rami, which are dis-

S. I LY . OF THE GREAT SYMPAINITIC NERVE.

ARSW.

tributed to the outer part of the Leg, and to the upper part of the Foot, where it is distributed to the Integuments.

SECTION LXX.

OF THE GREAT SYMPATHETIC NERVE.

- The GREAT SYMPATHETIC, or Intercostal Nerce, in placed on the anterior and lateral parts of the Spine, before the roots of the Transverse processes; extending from the Foramen Carotideum of the Temporal Bone, to the lower part of the Sacrum;
- It is considered generally as beginning from a branch of the sixth pair given off in the Cavernous Sinus, and which is soon joined by another from the Vedian Nerve.
- 3 It has, at different distances, a great number of Gangliform Tubercles, from which Ramifications proceed forward, as well as Filaments backward to the Ganglia of the Nerves of the Medulla Spinalis.
- * The Ganglia of the Great Sympathetic are divided into Cervical, Dorsal, Lumbar, and Sacral.
- 5 There are three Cervical Ganglia, a superior, a middle, and an inferior.
- of an oblong figure, situated longitudinally before the roots of the Transverse processes of the first three Vertebræ, and behind the Internal Carotid;
- ? It is closely connected with the eighth and ninth pairs,

Sect. LXX. OF THE GREAT SYMPATHETIC NERVE.

Answ.

and receives other filaments from them, as well as from the four Superior Cervical Nerves; it sends branches to the Pharynx, others which surround the blood vessels, and a branch to the Heart, called, the Superior, or Superficial Cardiac Nerve.

- In its course down the Neck to the last Cervical Vertebra, it communicates with the fifth and sixth Cervical and the Recurrent, and sends branches to the Cardiac Plexus.
- The MIDDLE CERVICAL GANGLION is not constant; when present it gives and receives the branches noticed as belonging to its Trunk in the Neck.
- The Inferior Cervical Ganglion is situated behind the Vertebral Artery, at the root of the Transverse process of the last Cervical Vertebra:
- It receives branches from the three Inferior Cervical and first Dorsal pair, and from the Recurrent; and sends branches to the Cardiac and Pulmonary Plexuses.
- The First Dorsal Ganglion is placed immediately below the Inferior Cervical, and behind the Subclavian Artery.
- These two Ganglia are connected to each other by a short portion of the Trunk, which is sometimes double and Plexiform, and by a branch which passes before the Subclavian Artery, thus forming an arch which encloses the Artery.
- *4 The Cardiac Nerves consist of branches from the 'Trunk of the Great Sympathetic in the Neck, (or from the middle Cervical Ganglion when present,)

Sect LXX. OF THE GREAT SYMPATHETIC NERVE.

Answ.

and from the inferior Cervical Ganghon; and meeting those from the other side, they form the CARDIAC PLEXOS, whose branches supply the Heart and its Pericardium.

- 15 From the First Dorsal Ganglion, the Great Sympathetic descends over the Ligaments, joining the Heads of the Ribs to the Vertebræ; on the last false Rib it bends toward the bodies of the Vertebræ.
- 16 Between each Rib it forms a Ganglion.
- 17 These Ganglia regularly communicate with the Dorsal Nerves, by two filaments from each.
- 18 Five, and sometimes more, considerable branches from several Ganglia below the fifth, pass forward and downward on the bodies of the Vertebræ: they unite and form one short Nerve on the last Dorsal Vertebra, called, the Splanchnic.
- 19 The Splanchnic Nerve perforates the upper and lateral part of the lower Muscle of the Diaphragm.
- 20 Having entered the Abdomen behind the Renal Capsule, it forms a large Ganglion, called, the Semilunar.
- 21 The Semilunar Gangl on forms a communication between the Splanchnic Nerve of each side, before the Aorta; it then forms the Solar Plexus, from whence proceed numerous branches to the different Viscera, viz.
- 22 The CELIAC, or STOMACHIC PLEXUS, to the Stomach.
- 23 The HEPATIC PLEXUS to the Liver, Duodenum, Pancreas.
- 24 The Splenic Plexus to the Spleen and Pancreas.

Sect. LXX. OF THE GREAT SYMPATHETIC NERVE.

Answ.

- 25 The RENAL, or EMULGENT PLEXUS, to the Kidneys.
- 26 The Superior Mesenteric Plexus, to the small Intestines.
- 27 The Inferior Mesenteric Plexus, to the large Intestines.
- 28 The Hypogastric Plexus, to the contents of the Pelvis.
- 29 The Spermatic Plexus to the Testicles.
- Nerve, perforates the inferior muscle of the Diaphragm, and then runs on the bodies of the Vertebræ, where it forms the Lumbar Ganglia.
- 31 Each Lumbar Ganglion receives two filaments from the corresponding Lumbar Nerve;
- 32 It passes into the Pelvis, communicating with the Sacral Nerves, where it forms the Sacral Ganglia;
- 33 It sends branches to the Inferior Mesenteric Plexus, and terminates by a communication with the Nerve of the opposite side, forming an inverted arch, where,
- 54 Together with the two lowest Sacral Nerves, it gives several Branches to the Rectum, Anus, and Cocci-geal Muscles.

PECULIARITIES OF THE FEMALE.

APPENDIX.

PECULIARITIES OF THE FEMALE.

Answ.

- 1 The Bones of the Female have some pecularities, for which, see page 88.
- The Integuments are softer than in the Male, and in the Face there is no Beard.
- 3 The leading anatomical peculiarities of the Female are the Organs of Generation, as described at page 214, and the Mammæ, or Breasts, subservient to them.
- The Mammæ are two glandular bodies, of a hemispherical figure, situated at the anterior and superior part of the Thorax, on the Pectoralis Major, and covered by the Skin.
- 5 They are of various size in different subjects, but they acquire their chief bulk at the age of puberty.
- 6 Each Mamma consists of the Papilla, or Nipple; the Areola, and the glandular Substance of the Mamma.
- 7 The Papilla, or Nipple, projects from the anterior and middle part of the Breast; it is of a red colour, and capable of erection;
- It consists of common Integuments, and of a firm elastic substance, in which are placed from fifteen to twenty ducts, called *Tubuli Lactiferi*; these are the excre-

Vol. II. Aa

PECULIARITIES OF THE FŒTUS.

Answ.

- tory ducts of the Gland, and terminate on the surface of the Nipple by open mouths.
- 9 The Areola is a circular disk at the base of the Nipple, and of a similar red colour, it contains numerous sebacious follicles.
- in a quantity of fat, which forms the great bulk of the Breast, it consists of numerous separate, white, glandular portions, from which the Lictiferous Tubes arise, and approach the Nipple, into which they run and terminate.
- 11 The Breasts secrete the milk for the purpose of nourishing the offspring; they are therefore hardly developed before the age of puberty, and shrink in old age.

PECULIARITIES OF THE FŒTUS.

- 1 The Bones of the Fotus are imperfectly formed; many of them consist of cartilage, whilst others are much more advanced; of this last kind are the Ossicula Auditus, the Clavicles, the Ribs, and the Vertebræ. Vide Osteogeny, page 10.
- The Address Substance is not found about the internal parts as in the adult, but is chiefly placed under the Skin.
- B The Brain and Nerves bear a larger proportion to the rest of the body.

PECULIARITIES OF THE FŒTUS.

Answ.

- 4 In the Eye a remarkable membrane blocks up the pupil, being attached to the loose edge of the Iris, called Membrana Pupillaris; it disappears sometime before birth.
- 5 The THYMUS GLAND is very large, and gradually disappears after birth—The LIVER is much larger, and so are the RENAL GLANDS; and the KIDNEYS are of a more lobulated form.
- 6 The Testicles, in the early months, are situated in the Cavity of the Abdomen, a little below the Kidneys; they gradually descend towards the abdominal Ring, and pass into the Scrotum.
- 7 The Parts peculiar to the Fætal Circulation are the Foramen Ovale of the Heart, the Canalis Arteriosus, the Canalis Venosus, the Funis or Umbilical Cord, the Umbilical Vein, and two Umbilical Arteries.
- 8 The Foramen Ovale is an oval opening in the Septum Auricularum, by which the blood passes from the right to the left Auricle; a Valve prevents its return in the contrary direction. In the adult this Foramen is almost completely obliterated, although its situation may always be perceived.
- 9 The Ductus Arteriosus connects the Pulmonary Artery to the ascending Arta, and mansmits the Blood, which cannot pass through the Lungs, from the right Ventricle into the Aorta.
- 10 The Ductus Venosus is little more than half an inch in length, and passes from the termination of the Umbi
 - lical Vein in the Liver to the inferior Vena Cava.

PECULIARITIES OF THE FŒTUS.

Answ.

- 11 The Umbilical Vein passes from the Umbilicus to the Liver.
- Arteries, and pass up the sides of the Bladder to the Umbilicus.
- The UMBILICAL CORD consists of three vessels, viz. the UMBILICAL VEIN, and the TWO UMBILICAL ARTERIES, which on quitting the Abdomen of the Fœtus at the Navel, unite and form this long Cord of communication with the Mother.
- 14 The Foetal Circulation is thus performed: the Blood is conveyed to the Fœtus through the Umbilical Vein, from which the greater part passes through the Liver, and the rest, by the Ductus Venosus, into the Vena Cava, and thus to the right Auricle. From this Auricle it partly passes into the right Ventricle, but partly also through the Foramen Ovale into the left Auricle. The portion which passes into the right Ventricle is transmitted, through the Pulmonary Artery, to the Lungs, in part, but chiefly through the Canalis Arteriosus into the Aorta. The Blood, which the Pulmonary Veins bring into the left Auricle, passes, with that received through the Foramen Ovale, into the left Ventricle, whence it is transmitted, through the Aorta, to the whole system, and returned by the Veins. To the Mother the Blood is returned by the Umbilical Arteries.
